

ASSAM SCIENCE AND TECHNOLOGY UNIVERSITY

Guwahati

Course Structure and Syllabus

(From Academic Session 2018-19 onwards)

B.Tech 1st Semester (Group B)

For the branches:

- **Electrical Engineering (EE)**
- **Computer Science and Engineering (CSE)**
- **Electronics and Communication Engineering (ECE)**
- **Electronics and Telecommunication Engineering (ETE)**
- **Instrumentation Engineering (IE)**
- **Power Electronics and Instrumentation (PEI)**
- **Electrical and Electronics Engineering (EEE)**

NOTE: Three weeks Mandatory Induction Program need to be done before the commencement of the B.Tech 1st semester classes as per the AICTE mandate

Mandatory Induction Program

3 weeks duration	
<ul style="list-style-type: none">• Physical activity• Creative Arts• Universal Human Values• Literary• Proficiency Modules• Lectures by Eminent People• Visits to local Areas• Familiarization to Dept./Branch & Innovations

PH181101	Physics-101	3-1-0	4

MODULE 1: Introduction to Electromagnetism (8 Lectures)

Introduction to Gradient, Divergence and Curl, Laplace's and Poisson's equation for electrostatic potential. **(2 lectures)**

Biot-Savart law, Ampere's law, Inconsistency in Ampere's law, Continuity equation, Displacement current, Maxwell's equations with significance. **(3 lectures)**

Classification of magnetic materials – Diamagnetism, Paramagnetism, Ferromagnetism, Domain theory, Hysteresis loop, Hysteresis loss, Soft and Hard magnetic materials. **(3 lectures)**

MODULE 2: Optics (7 Lectures)

Aberration in lenses, Spherical and Chromatic Aberration, Method of minimization of Spherical and Chromatic Aberration. **(3 Lectures)**

Interference of light by division of wave front (brief discussion) & division of amplitude, Interference due to reflected light in plane parallel film, Interference in variable thickness (wedge shaped) film, Newton's rings. **(4 Lectures)**

MODULE 3: Lasers, Fibre Optics and Holography (9 Lectures)

Induced absorption, spontaneous and stimulated emission, Einstein's coefficients, population inversion, pumping, meta-stable state, principle of LASER, characteristics of a laser beam, Gas (He-Ne) laser, Solid state (Nd:YAG) laser and semiconductor laser, Applications of lasers. **(4 Lectures)**

Optical fibre - Principle and Structure, Propagation of light in optical fibres, Numerical aperture and angle of acceptance, Classification of optical fibres – Fiber optics materials, Single mode and Multimode optical fibres, Step Index and Graded Index optical fibres, Losses in fibres, Optical fibre communication system (Block diagram only), Introduction to Holography. **(5 Lectures)**

MODULE 4: Quantum Mechanics (5 Lectures)

Wave nature of particles, Uncertainty principle, Wave function and wave packets, Time dependent & time independent Schrodinger equation, Solution of Schrödinger's equation for one dimensional problem: Particle in a box.

MODULE 5: Solid, Semiconductors and Superconductivity (9 Lectures)

Free electron theory of metals, Density of States, Fermi level, Kronig Penny Model (Qualitative) and origin of energy bands: Metals, Semiconductors and Insulators, Solar Cell, LED, Hall effect. **(5 Lectures)**

Properties of Superconductors; Meissner effect, Critical Magnetic Field, Isotope effect, Persistent current, Magnetic levitation, Type-1 & Type-2 superconductors and their comparison, BCS theory of superconductivity (qualitative only). **(4 Lectures)**

Note: *The syllabus of Physics PH181101 for Group B is designed as per the AICTE directives to teach different topics of Physics to different branches of Engineering to cater to their specific needs. However, in order to give the students a complete essence of Physics, the following topics may be taught in brief (maximum 4 hours) in tutorial classes, or may be encouraged to learn these topics by using online resources e.g. NPTEL lectures etc. and assignments may be given to ensure their learning. These topics, however, are not to be included in end semester examinations:*

- *Central forces, conservative and non-conservative forces, Definition of Torque, Principle of conservation of angular momentum;*
- *Definition of Viscosity, Stoke's law, Terminal velocity, Streamline and Turbulent flow (Qualitative);*
- *Definitions of Stress, Strain, the three moduli of elasticity and Poisson's Ratio.*

Text Books:

1. Applied Physics for Engineers – Neeraj Mehta (PHI Learning Pvt. Limited)
2. A text Book of Engineering Physics – Dr. M.N. Avadhanulu and Dr. P.G. Kshirsagar (S. Chand and Company Pvt. Limited)

Reference Books:

1. Introduction to Electrodynamics – D. J. Griffiths (Prentice Hall)
2. A Detailed text book of Engineering – Dr. S.P. Basavaraju (Subhas Stores, Bangalore)

Course Outcome: After successful completion of the course, the students will be able to:

CO1: Apply the theoretical fundamentals of electromagnetism and optics to solve Engineering problems.

CO2: Relate the applications of lasers, Fibre optics and Holography to Engineering problems.

CO3: Explain the different aspects of Quantum Mechanics.

CO4: Explain the properties of metals, semi-conductors and super conductors as required for Engineering applications.

Course Code	Course Title	Hours per week L-T-P	Credit C
MA181102	Mathematics-I	3-1-0	4

CALCULUS AND LINEAR ALGEBRA

MODULE 1: Calculus (8 lectures)

Reduction formulae, applications of definite integrals to evaluate surface areas and volumes of solids of revolution, idea of improper integrals, Beta and Gamma functions and their properties.

MODULE 2: Calculus (8 lectures)

Successive differentiation, standard forms, Leibnitz's theorem (without proof), Taylor's and Maclaurin's theorem with remainders, indeterminate forms and L' Hospital's rule, Curvature and Radius of curvature (both in Cartesian and Polar co-ordinates).

MODULE 3: Sequences and series (6 lectures)

Idea of convergence of sequence and series, Fourier series, Half range sine and cosine series, Parseval's theorem.

MODULE 4: Multivariable Calculus (8 lectures)

Partial derivatives, Euler's theorem, Total derivatives, Maxima, Minima and saddle points, Method of Lagrange multipliers, Double and Triple Integrals and its applications to find areas and volumes.

MODULE 5: Linear Algebra (10 lectures)

Inverse and rank of a Matrix, Linear independence of vectors, rank-nullity theorem, system of linear equations, Symmetric, skew-symmetric and orthogonal matrices, Eigen values and eigen vectors, Diagonalization of matrices, Cayley-Hamilton theorem (without proof), Orthogonal Transformation.

Suggested Text/ Reference Books:

1. Erwin Kreyszig, Advanced Engineering Mathematics, 9th Edition, John Wiley & Sons, 2006.
2. G.B. Thomas and R.L. Finney, Calculus and Analytic geometry, 9th Edition, Pearson, Reprint, 2002.
3. Veerarajan T., Engineering Mathematics for first year, Tata McGraw-Hill, New Delhi, 2008.
4. Ramana B.V., Higher Engineering Mathematics, Tata McGraw Hill New Delhi, 11th Reprint, 2010.
5. D. Poole, Linear Algebra: A Modern Introduction, 2nd Edition, Brooks/Cole, 2005.

6. N.P. Bali and Manish Goyal, A text book of Engineering Mathematics, Laxmi Publications, Reprint, 2008.
7. B.S. Grewal, Higher Engineering Mathematics, Khanna Publishers, 36th Edition, 2010.

Course Outcome: After successful completion of the course, the students will be able to:

- CO1:** apply the techniques of differential and integral calculus to solve simple Engineering problems.
- CO2:** Interpret the significance of Beta and Gamma functions.
- CO3:** apply Rolle's Theorem, power series and Fourier series to Engineering problems.
- CO4:** apply multi-functional variables, matrices and linear algebra as tools to solve Engineering problems.

Course Code	Course Title	Hours per week L-T-P	Credit C
CE181103	Engineering Graphics and Design	1-0-4	3

MODULE 1: Introduction to Engineering Drawing (8 Lectures)

- i. Principles of Engineering Graphics and their significance, usage of Drawing instruments.
- ii. Lettering: Single stroke letter – Vertical and inclined capital and small letter,
- iii. Scales: Plain scale and vernier scale.
- iv. Curves: Conic sections – Ellipse, parabola, hyperbola, different methods of construction of conic sections, tangents and normal to conics.

MODULE 2: Orthographic Projections (14 Lectures)

- i. Principles of Orthographic Projections- Conventions
- ii. Projection of points : Introduction of projection, quadrants, 1st , 2nd , 3rd and 4th angle projection of points.
- iii. Projection of lines (First angle only) : Line parallel to one or both planes, line perpendicular to a plane, line inclined to one plane and parallel to other, line inclined to both plane.
- iv. Projections of planes (First angle only): Plane perpendicular to one plane and parallel to other, plane perpendicular to both plane, plane inclined to one plane and perpendicular to other.
- v. Projection of solids (First angle only) : Axis perpendicular to one plane and parallel to other, axis parallel to both plane, axis inclined to one plane and parallel to other, axis inclined to both plane.

MODULE 3: Sections and Sectional Views of Right Angular Solids (4 Lectures)

Section of solids: Section plane parallel to one plane and perpendicular to other, section plane inclined to one plane and perpendicular to other.

MODULE 4: Isometric Projections (4 Lectures)

Principles of Isometric projection – Isometric Scale, Isometric Views, Conventions; Isometric Views of lines, Planes, Simple and compound Solids; Conversion of Isometric Views to Orthographic Views and Vice-versa, Conventions.

MODULE 5: Introduction of Computer Graphics (6 Lectures)

Demonstrating knowledge of the theory of CAD software such as: The Menu System, Toolbars (Standard, Object Properties, Draw, Modify and Dimension), Drawing Area (Background, Crosshairs, Coordinate System), Dialog boxes and windows, Shortcut menus (Button Bars), The Command Line (where applicable), The Status Bar, Different methods of zoom as used in CAD, Select and erase objects.; applying dimensions to objects, applying annotations to drawings; Setting up and use of Layers, layers to create drawings, Create, edit and use customized layers; Changing line lengths through modifying existing lines

(extend/lengthen). Drawing simple shapes such as circle, parabola, etc. Drawing geometric solids; Drawing annotation, solid, surface, and wireframe models.

**MODULE 6: Demonstration of simple team design (Students Project as group work)
(4 Lectures)**

Creation of engineering models and their presentation in standard 2D blueprint form, 3D wire-frame and shaded solids; meshed topologies for engineering analysis. Drawing of floor plans, front elevation and sectional elevation showing floor level to ceiling of a simple two storied building with doors and windows.

NOTE:

- 1. Assessment of student based on above syllabus comprises of three parts**
 - a. Theory examination covering Module 1 to Module 4
 - b. Practical Examination covering Module 5
 - c. Project covering Module 6

Text/Reference Books:

1. Bhat, N.D.& M. Panchal (2008), Engineering Drawing, Charotar Publishing House
2. Shah, M.B. & B.C. Rana (2008), Engineering Drawing and Computer Graphics, Pearson Education
3. Dhawan, R.K. (2007), A Text Book of Engineering Drawing, S. Chand Publications
4. Narayana, K.L. & P Kanniah (2008), Text book on Engineering Drawing, Scitech Publishers.
5. Shah, M.B. & Rana B.C. (2008), Engineering Drawing and Computer Graphics, Pearson Education
6. User manual of CAD software.

Course Outcome: After successful completion of the course, the students will be able to:

CO1: Explain the basic principles of Engineering Graphics.

CO2: Apply the principles of orthographic and isometric problems to represent simple Engineering objects.

CO3: Apply the principle of sectioning to represent different views of Right Angular Solids.

CO4: Create simple shapes like Circle, parabola, geometric solids etc. using CAD software.

CO5: Demonstrate team work spirit through creation of Engineering models and their presentations.

Course Code	Course Title	Hours per week L-T-P	Credit C
ME181104	Engineering Mechanics	3-0-0	3

MODULE 1: Equilibrium of Rigid Bodies (6 Lectures)

Introduction, Free body diagram (FBD), Types of supports and their reactions, System of forces, Resultant of coplanar concurrent forces and non-concurrent force systems, Conditions of equilibrium, (i) concurrent forces in space (ii) non-concurrent forces in space.

MODULE 2: Analysis of Structures (3 Lectures)

Method of joint, method of sections, graphical methods.

MODULE 3: Friction (3 Lectures)

Introduction, laws of Coulombs friction, equilibrium of bodies involving dry friction; inclined plane, ladder friction, wedge friction.

MODULE 4: Centre of Gravity and Moment of Inertia (6 Lectures)

(i) Centre of gravity and centroid; location of centroid and centre of gravity (ii) Moment of inertia of plane area, Parallel axis theorem, perpendicular axis theorem, mass moment of inertia, polar moment of inertia, radius of gyration, product of inertia, M.I. of simple and composite bodies.

MODULE 5: Lifting Machines (4 Lectures)

Introduction, Principles of machines, reversibility of machines, lever, pulley, simple wheel and axle.

MODULE 6: Virtual Work and Energy Method (4 Lectures)

Introduction, virtual displacement, principle of virtual work, application of virtual work.

MODULE 7: Impulse, Momentum, Work and Energy (4 Lectures)

Linear impulse and momentum, Principle of work-energy conservation.

Text Books:

1. Engineering Mechanics by IH Shames, PHI.
2. Engineering Mechanics, Mariam and Craig, Wiley.

Reference Books:

1. Engineering Mechanics by S. Timoshenko and D.H. Young, McGraw Hill Int.
2. Engineering Mechanics by R.K. Banshal, Laxmi Publication (P) Ltd.
3. Engineering Mechanics by K.L. Kumar, McGraw Publishing Co.
4. Engineering Mechanics by Hibbler.

5. Engineering Mechanics by D.P Sharma, Pearson.
6. Engineering Mechanics Statics and Dynamics by A Nelson, McGraw Hill.
7. Engineering Mechanics by S.S. Bhavikatti, New Age International Publishers.

Course Outcome: After successful completion of the course, the students will be able to:

CO1: Explain the construction of Free Body Diagrams of rigid bodies in equilibrium, subjected to coplanar concurrent and non-concurrent forces.

CO2: Analyse structures by the method of joints, sections and graphically.

CO3: Apply the concepts of C.G. and M.I. to find the C.G. and M.I. of simple and composite bodies.

CO4: Explain the working principle of Lifting Machines.

CO5: Apply the principle of Virtual work and Work-Energy Conservation to solve simple Engineering problems.

Course Code	Course Title	Hours per week L-T-P	Credit C
HS181105	Sociology	2-0-0	2

MODULE 1: Understanding of Sociology (5 Lectures)

Introduction to sociology: Meaning and definition of sociology, nature and scope of sociology, significance of sociology; understanding of society and social institutions: family, community, group, culture and civilization, marriage, family, religion.

MODULE 2: Gender and Society (4 Lectures)

Concept of gender, differences between sex and gender, changing gender roles in society, gender equality and inequality, gender and poverty, gender discrimination.

MODULE 3: Social Change (5 Lectures)

Meaning and definition of social change, nature and characteristics of social change, modernization, industrialization, information and technology. Social disorganization and social problems (over population, poverty, unemployment, corruption and black money).

MODULE 4: Industrial Disputes (5 Lectures)

Meaning and definition of industrial disputes, causes and methods of settlement of industrial disputes. Trade union- definition of trade union, functions of trade union, problems of trade union in India. Indian factories Act, 1948.

MODULE 5: Human Resources (5 Lectures)

Meaning of human resources, significance of human resources, meaning of manpower planning, concept of productivity, factors of productivity, factors affecting productivity, workers' participation in management, unilateral and cooperative participation.

Textbooks/ References:

1. C.N. Shankar Rao: Principles of Sociology, New Delhi: S.Chand & Co. Ltd., 2006.
2. Mamoria C.B. , Mamoria S and Gankar. Dynamics of Industrial Relations in India, Himalaya Publishing House, New Delhi.
3. John, Mary E. Women's studies in India. New Delhi: Penguin, 2008.
4. Tong, R. Feminist Thought. Colorado: Westview Press, 2009.
5. Ram Ahuja - Social Problems in India, Jaipur: Rawat Publications, 2001.
6. M.N.Srinivas: Caste in Modern India, Oxford University Press, 1992.
7. Principles of Sociolgy by R.N. Sharma.

8. Labour problems and social welfare by R.C.Saxena.

9. Labour problems and social welfare by U.C.Kulshrestha.

Course Outcome: After successful completion of the course, the students will be able to:

CO1: Develop their sociological thinking to demonstrate sociological understandings of phenomena, for example, how individual biographies are shaped by social structures, social institutions, cultural practices, and multiple axes of difference and/or inequality.

CO2: Identify the major concepts and perspectives of sex-gender systems and practices in contemporary society.

CO3: Develop the ability of critical thinking through the ability to analyze and evaluate social, political, and/or cultural changes in society.

CO4: Exhibit the knowledge of sociological perspective of industry, conflict resolution and labour/management relation in industry.

CO5: Analyse the significance of human resources and its participation in various sectors of society.

Course Code	Course Title	Hours per week L-T-P	Credit C
PH181111	Physics-101 Lab	0-0-2	1

List of Experiments:

1. To find the Young's Modulus of Elasticity of the material of a wire by Searle's apparatus.
2. To find the value of the acceleration due to gravity by using: Bar Pendulum /Kater's Pendulum.
3. To determine the radius of curvature of the curved surface of the Plano convex lens or the wavelength of the source of light by Newton's Ring Method.
4. To determine the value of Mechanical Equivalent of heat, J by electrical method (using Joule's Calorimeter).
5. To find the Horizontal component of the Earth's magnetic field by using magnetometers.
6. To find the current flowing in an external circuit by using a potentiometer.
7. To find the powers of two given lenses (concave and convex), by using an optical bench.
8. To draw the characteristics curves of a Semiconductor Diode (p-n junction diode).
9. To find the value of a low resistance by the drop of potential method using a Meter Bridge.
10. To find the angle of acceptance and hence calculate the numerical aperture of an optical fibre.

Text Books:

1. A Text Book on Practical Physics – K.G. Mazumdar and B. Ghosh (Sreedhar Publishers).
2. A Text book of Practical Physics - Samir Kumar Ghosh (New Central Book Agency).

Course Outcome: After successful completion of the course, the students will be able to:

CO1: Carry out experiments to determine Young's Modulus of Elasticity of a wire and acceleration due to gravity using bar pendulum.

CO2: Determine the radius of curvature of curved surface of the plano-convex lens and wavelength of light source by Newton's Ring Method.

CO3: Determine the value of Mechanical equivalent of heat, horizontal component of the Earth's magnetic field and current flowing in external circuit by using a potentiometer.

CO4: Determine the power of two given lenses (Concave and Convex)

CO5: Carry out experiments to draw the characteristics curve of a semiconductor diode, find the value of low resistance, the angle of acceptance and numerical aperture of an optical fibre.

Course Code	Course Title	Hours per week L-T-P	Credit C
ME181114	Engineering Mechanics Lab	0-0-2	1

List of Experiments:

1. To verify the law of polygon of forces for a numbers of coplanar forces in equilibrium.
2. Parallel Forces Apparatus:
 - A. To show experimentally the inverse relationship between reactive forces at support and the distance of the point of application of loads from supports.
 - B. To find the reactive forces at the supports using:
 - (i) Experimentally, (ii) Analytical method
3. Rolling Friction Apparatus:
Experimental Computation of Co-Efficient of Friction between an Inclined Plane (Glass) and Trolley (Iron).
4. Square Threaded Screw Jack
 - A. To determine the Velocity Ratio, Mechanical Advantage and Efficiency of a Square Threaded Screw Jack
 - B. To construct the Curves showing relations of $P - W$, $MA - W$, $\eta - W$
5. To verify the Law of Moments by using a Bell Crank Lever
6. To verify the equilibrium of forces with the help of force polygon apparatus
7. To determine the co-efficient of friction between the slider and the inclined plane (sliding friction)

Course Outcome: After successful completion of the course, the students will be able to:

CO1: Establish the law of polygon of forces and equilibrium of forces through experimentation.

CO2: Determine the reactive forces at support and its relationship with the distance of the point of application of loads from support.

CO3: Determine the co-efficient of Rolling and Sliding friction on an inclined plane through experimentation.

CO4: Determine the velocity ratio, Mechanical advantage and efficiency of a square threaded screw jack.

CO5: Verify the law of moments by using a Bell crank lever.

ASSAM SCIENCE AND TECHNOLOGY UNIVERSITY

Guwahati

Course Structure and Syllabus

(From Academic Session 2018-19 onwards)

B.Tech 2nd Semester (Group B)

For the branches:

- **Electrical Engineering (EE)**
- **Computer Science and Engineering (CSE)**
- **Electronics and Communication Engineering (ECE)**
- **Electronics and Telecommunication Engineering (ETE)**
- **Instrumentation Engineering (IE)**
- **Power Electronics and Instrumentation (PEI)**
- **Electrical and Electronics Engineering (EEE)**

NOTE: Four weeks Mandatory Internship need to be done in 2nd semester break (summer break) as per the AICTE mandate

COURSE OBJECTIVES

To introduce specific fundamental as well as applied concepts of Chemistry relevant for the study of topics in different branches of Engineering.

MODULE 1: Atomic Structure (5 Lectures)

Schrodinger's wave equation, Physical significance of Ψ and Ψ^2 , Hydrogen atom wave functions-Radial and Angular wave function, Eigen value, Eigen function, Molecular orbital theory-electronic configurations of molecules in terms of the MO-Homonuclear diatomic molecule, Heteronuclear diatomic molecule. (Eg. CO, NO)

MODULE 2: Polymer Chemistry (6 Lectures)

Classification, Functionality, Determination of molecular weights, Polydispersity index (PDI). Types of polymerization (Addition and Condensation). Structure-property-application of few commodity polymers (eg. PE, PP, PS, PMMA, PVC, Isoprene.), Biopolymer-properties and its applications (polylactic acid) and Conducting polymer-properties and its applications (polyacetylene).

MODULE 3: Nanochemistry (5 Lectures)

Introduction, Synthesis of nanomaterials (Top-down and Bottom-up approach). Fullerenes, Carbon nanotube (Characteristic, properties & application), Nanowire, Application of Nanomaterial in catalysis, Medicine, Energy science, Bio nanomaterials.

MODULE 4: Sustainable Chemistry (6 Lectures)

Principles of green chemistry, Idea of green synthesis, Carbon footprint and sequestration, Carbon trading. Brief idea of alternative solvents–Water, ionic liquids, supercritical fluid system (Carbon dioxide), Waste management: Solid, electronic & industrial wastes, Waste management procedures and relevant standards.

MODULE 5: Corrosion Science (6 Lectures)

Definition and scope of corrosion. Dry chemical corrosion and electrochemical corrosion and their mechanisms. Types of electrochemical corrosion (Differential aeration, Galvanic, Concentration cell), Typical electrochemical corrosion like Pitting, Inter-granular, Waterline. Factors affecting corrosion, Protection against corrosion.

MODULE 6: Instrumental Methods of Chemical Analysis (8 Lectures)

Spectroscopy: Principle of spectroscopy, Principle and applications of UV-Visible spectroscopy. Applications of Flame photometry, Atomic absorption spectroscopy, Infrared spectroscopy, NMR spectroscopy, Mass spectroscopy. Principle and applications of different Chromatographic Techniques-Gas, HPLC, GPC.

MODULE 7: Battery technology & Engineering materials (6 Lectures)

Cell and battery-characteristics (emf, capacity, power ampere-hour, power density, efficiency, cycle life), Fundamentals of primary cell (Dry cell), Rechargeable batteries, Li-ion battery, Fuel cell, Liquid Crystal-Introduction, Types, Applications of liquid crystal- LCD, LCT (Liquid crystal thermometer)

Text Book/ Reference Books:

1. Engineering Chemistry-Jain & Jain (Dhanpat Rai & Company)
2. Engineering Chemistry-Shashi Chawla (Dhanpat Rai & Company)
3. Industrial Chemistry-B. K. Sharma
4. A text book of Engineering Chemistry-Dr S. Rattan
5. Wiley Engineering Chemistry
6. Atomic Structure and Chemical bond-Manas Chandra (TMH edition)
7. Quantum Chemistry-B.K. Sen
8. Quantum Mechanics-L. Pauling & E. Wilson (McGraw Hill Book Company)
9. Physical Chemistry-P. W. Atkins (Oxford University Press)
10. Advance Inorganic Chemistry- Cotton et. Al. (John Willey)
11. Inorganic Chemistry-Shriver, Atkins, Langford (ELBS)
12. Green Chemistry-Paul T Anastas, John C. Warner
13. Introduction to Polymers-R. J. Young
14. Polymer Science-V.R.Gowarikar (New Age International)
15. Fundamentals of Molecular Spectroscopy-C. N. Banwell & E. N. McCash
16. Atomic & Molecular Spectroscopy-Chatwal & Anand (Himalayan Publishing House)

Course Outcome: After successful completion of the course, the students will be able:

CO1: To apply Molecular Orbital Theory along with electronic configuration on the basis of Schrodinger wave equation for homonuclear and heteronuclear diatomic molecules (NO, CO).

CO2: To illustrate the different aspects of polymer chemistry and its uses in different purposes along with brief idea of nanomaterials as well as sustainable chemistry with applications.

CO3: To apply the idea of corrosion along with control and preventive measures.

CO4: To apply the fundamental principles and applications of analysis using UV-Visible, Flame photometry, AAS, IR, NMR, mass spectroscopy and chromatography.

CO5: To demonstrate the fundamentals of different cells and engineering materials along with various applications.

Course Code	Course Title	Hours per week L-T-P	Credit C
MA181202	Mathematics-II	3-1-0	4

CALCULUS, ORDINARY DIFFERENTIAL EQUATIONS AND COMPLEX VARIABLE

MODULE 1: Vector Calculus (10 lectures)

Differentiation of vectors, Gradient, Divergence and Curl, Directional Derivatives, Line, Surface and volume Integrals; Green, Gauss and Stokes Theorems (without proof) and their applications.

MODULE 2: First order ordinary differential equations (6 lectures)

Exact, linear and Bernoulli's equations, Euler's equations, Equations not of first degree: equations solvable for p, equations solvable for y, equations solvable for x and Clairaut's type.

MODULE 3: Ordinary differential equations of higher orders (10 lectures)

Second order linear differential equations with constant co-efficients, Power series solutions: Legendre Polynomials, Bessel functions of first kind and their properties.

MODULE 4: Complex Variable – Differentiation: (6 lectures)

Differentiation, Analytic functions, Cauchy-Riemann equations, Harmonic functions, Finding harmonic conjugate; Elementary analytic functions (exponential, trigonometric, logarithm) and their properties; Conformal mappings, Mobius transformations and their properties.

MODULE 5: Complex Variable – Integration: (8 lectures)

Contour integrals, Cauchy-Goursat theorem (without proof), Cauchy Integral formula (without proof), Liouville's theorem and Maximum-Modulus theorem (without proof); Taylor's series, zeros of analytic functions, singularities, Laurent's series; Residues, Cauchy Residue theorem (without proof), Evaluation of definite integral involving sine and cosine, Evaluation of certain improper integrals using the Bromwich contour.

9. B.S. Grewal, Higher Engineering Mathematics, Khanna Publishers, 36th Edition, 2010.

Course Outcomes: After successful completion of the course, the students will be able to:

CO1: Apply techniques for evaluating multiple integrals, ordinary and partial differentiation equations and that of complex variables to deal with varied Engineering problems.

CO2: Make use of advanced level of Mathematics as tools for solving problems related to modelling of physical processes.

Course Code	Course Title	Hours per week L-T-P	Credit C
CS181106	Problem Solving Through Programming Using C	2-0-2	3

MODULE 1: Introduction to Programming (3 Lectures)

Introduction to components of a computer system (disks, memory, processor, where a program is stored and executed, operating system, system software, application software, compilers, interpreter etc.

Idea of Algorithm: steps to solve logical and numerical problems. Representation of Algorithm: Flowchart/Pseudo code with examples.

From algorithms to programs; source code, compilation, object and executable code, Syntax and Logical Errors in compilation, storage of data inside program using variables, data types, modular programming, structure of a C program.

MODULE 2: Expressions and precedence (2 Lectures)

Writing C expressions using operators (arithmetic, relational, logical, dereferencing, arrow operator, period operator, conditional operator, subscript operator etc.), identifiers and literals, precedence of operators, evaluation of expressions using precedence and associativity rules.

MODULE 3: Conditional Branching and Loops (4 Lectures)

Writing and evaluation of conditionals and consequent branching using if..else and switch..case statements, Iteration and loops using for loop, while loop and do..while loop.

MODULE 4: Arrays (2 Lectures)

Arrays (1-D, 2-D), Character arrays and C Strings.

MODULE 5: Basic Algorithms (4 Lectures)

Searching (sequential and binary), Basic Sorting Algorithms (Bubble, Insertion and Selection), Finding roots of equations, notion of order of complexity through example programs (no formal definitions for asymptotic analysis required).

MODULE 6: Function (3 Lectures)

User defined functions and built in libraries, function prototype, parameter passing in functions, call by value, passing arrays to functions: idea of call by reference (1-D and 2-D), scope rules for C language.

MODULE 7: Recursion (2 Lectures)

Recursion, as a different way of solving problems, example programs, such as Finding Factorial, Fibonacci series.

MODULE 8: Structure (2 Lectures)

Structures, defining structures, Accessing members, Array of Structures.

MODULE 9: Preprocessor Directives (1 Lecture)

#define, #include, #ifdef etc., conditional compilation.

MODULE 10: Pointers (4 Lectures)

Idea of pointers, defining pointers, pointer and arrays, pointer to structure, pointer to function, passing addresses of variables to functions (elementary and user defined), double indirection, Use of Pointers in self-referential structures, dynamic allocation/deallocation of memory blocks data types like elementary data types, arrays, structures, accessing elements of dynamically allocated memory, notion of linked list (no implementation).

Text Books:

- (1) Byron Gottfried, Schaum's Outline of Programming with C, McGraw-Hill
- (2) Yashavant Kanetkar, Let us C, BPB Publication
- (3) E. Balaguruswamy, Programming in ANSI C, Tata McGraw-Hill
- (4) Yashavant Kanetkar, Understanding Pointers in C, BPB Publication

Reference Books:

- (1) Brian W. Kernighan and Dennis M. Ritchie, The C Programming Language, Prentice Hall of India

Course Outcomes (Theory)

Course Outcome	Statement
CO1	To design, represent and analyze algorithms for logical and numerical problems
CO2	To develop modular programs using functions and recursion
CO3	To create programs using static built-in and user defined data types for storage and processing of data
CO4	To develop programs for dynamic storage and processing of data
CO5	To develop solution for a computing problem through team work

Laboratory - Programming for Problem Solving

Total: 26 contact hours, 2 hours of lab/week

[to be evaluated for Continuous Evaluation (CE): 30 marks]

Lab1: Familiarization with programming environment (editors, compilation, debugging etc.)
(2 hours)

Lab 2: Simple computational problems using expressions and precedence (2 hours)

Lab 3: Problems involving using if-then-else and switch statements (2 hours)

Lab 4: Iterative problems e.g., sum of series, factorial, Fibonacci series etc. (2 hours)

Lab 5: 1D, 2D Array manipulation: summation, finding odd/even in a set, string handling etc. (4 hours)

Lab 6: Matrix problems (addition, multiplication etc.), String operations (finding length, concatenation, comparing etc.)(4 hours)

Lab 7: Simple function illustrating the concepts, call by value (2 hours)

Lab 8: Recursive functions for summation, Fibonacci series, and factorial (2 hours)

Lab 9: Pointers, call by reference, passing arrays to functions, passing address of structure to function, passing array of structure to function, pointers and arrays, function pointer, dynamic allocation of block of memory and accessing the elements (4 hours)

Lab 10: File operations on text files, binary files (2 hours)

Course Outcomes for Laboratory

Course Outcome	Statement
CO1	To translate a given algorithm to C program and become familiarized with programming environments
CO2	To build programs using modular programming and recursion
CO3	To build programs using built-in and user defined data types for data processing
CO4	To build programs for data processing using dynamic memory management
CO5	To solve a computational problem through team work
CO6	To exhibit self-learning by writing programs for solving problems in differentiation and integration by numerical methods

Course Code	Course Title	Hours per week L-T-P	Credit C
EE181107	Basic Electrical Engineering	3-0-0	3

Objectives:

- To impart the basic knowledge of electric and magnetic circuits and to give idea of the AC fundamentals
- To impart the basic knowledge of working principles and applications of various electrical machines
- To impart the basic knowledge of working principles and applications of various measuring instruments
- To impart the basic knowledge of the electric house wiring and make the students aware of the electrical safety measures.

MODULE 1: DC Circuits (8 Lectures)

Definitions of active, passive, linear, nonlinear circuit elements and networks. Kirchoff's laws, nodal & mesh analysis, voltage & current sources, network theorems- superposition, Thevenin's, Norton's and maximum power transfer theorems.

MODULE 2: AC Circuits (12 Lectures)

Waveforms of alternating voltages and currents, instantaneous, average and RMS values, form factor & peak factor, forms of representation of alternating quantities, concept of phasor & phasor diagrams, Concept of lead & lag, reactances & impedances, AC circuits-resistive, inductive, capacitive, RL, RC & RLC series, parallel and series parallel combination, impedance triangle, admittance, active & reactive power & power factor.

Concepts of 3-phase AC, connections, phase & line values in star & delta connections, solutions of simple 3-phase balanced circuits with resistive & reactive loads, 3-phase power, and phase sequence

MODULE 3: Electrical Machines (12 Lectures)

Single Phase Transformers: Principle of operation, EMF equation, losses and efficiency, Basic idea of an auto-transformer.

DC machines: Electromechanical Energy Conversion, EMF and torque equations, Classification, characteristics and applications of various types of d.c. motors.

Induction Motors: Principle of operation of single phase and three phase induction motors, Application of Induction motors

MODULE 4: Instruments (4 Lectures)

Classification of instruments, essentials of indicating type instruments- deflecting torque, controlling torque, damping; types of indicating instruments, MC & MI type ammeters & voltmeters, extension of range- use of shunt & multipliers.

MODULE 5: Basics of Electrical Installations (4 Lectures)

Basic knowledge of domestic wiring, types of cables (names only), types of wiring; circuit layouts- single phase AC mains to DB; 3 phase connections; accessories- main switch, ceiling rose, fuse, MCB etc. Earthing- purpose & methods.

Text/Reference Books:

1. Basic Electrical Engineering--- Nagrath.
2. Basic Electrical Engineering---Mittle.
3. B.E.E. Science—Sahadev & Rana.
4. Electro-Technology—H. Cotton.
5. A text book of Electro-technology- B.L.Theraja.

Course Outcomes: On successful completion of the course, the student will be able to:

CO1: Identify and analyze network theorems / a. c fundamentals and apply them to the solution of electrical engineering problems.

CO2: Gain basic idea of electrical quantities, such as current, voltage, power, energy, phase, frequency etc. and co-relate these concepts in various fields of electrical engineering.

CO3: Understand the principle of operation of different types of electrical machines.

CO4: Understand the basic principle of operation and use of different types of measuring instruments.

CO5: Get concrete idea about electrical installations and importance of the safety measures to be taken in this regard.

Course Code	Course Title	Hours per week L-T-P	Credit C
HS181108	Communication and Professional Skill	1-0-2	2

MODULE 1: Basic Communication (4 Lectures)

Concept and meaning of communication; Importance of communication, Objectives of communication, Process of communication, Characteristics of communication, Forms of communication, Barriers to communication, Communication Breakdown, Effective communication.

MODULE 2: Audience Analysis (3 Lectures)

Audience awareness, Audience analysis, Types of audience, Importance of audience analysis, Audience Profile, Analysing individual and group of audience, Adapting message to audience.

MODULE 3: Job Oriented Communication (5 Lectures)

Introduction to soft skills, Antiquity of soft skills, Classification of soft skills, Combating stage fright, Pre-presentation preparation, Guidance for effective delivery, Creating and designing of Power Point slides, Presentation Delivery, Organizational group discussion, Group discussion as part of selection process, Conferences, Symposia and Seminars, Job Interview, Objectives of interviews, Types of interview, Ground work before interview, Internship and Campus placement.

MODULE 4: Technical report writing (4 Lectures)

Concept of report writing, Importance of report, Characteristics of a report, Categories of report, Formats, Structure of a technical report, Planning, Drafting, Referencing and Styling

MODULE 5: Academic writing and Comprehension skills (3 Lectures)

Précis writing, Presenting Research paper and articles. Miscellaneous grammar.

MODULE 6: Job oriented writing skill (5 Lectures)

Official letters- Formats, Types and Language, Memo writing, Emails, Resume and Curriculum Vitae--the first step forward and Job application.

Reference Books:

1. Effective Technical Communication, M. Ashraf Rizvi. Tata McGraw Hill
2. Technical Communication: Principles and Practice, Meenakshi Raman and Sangeeta Sharma. OUP
3. Personality Development and Soft Skills, B.K.Mitra, OUP
4. Technical Communication for Engineers, S.Verma, VIKAS Publishing House Pvt. Ltd.

Course Outcome:

On successful completion of the course the students will be able to:

CO1: Expand and develop basic understanding of the importance of communication.

CO2: Familiarise with different aspects of accurate and effective communication.

CO3: Demonstrate different writing skills i.e. technical, non-technical and other texts.

CO4: Prepare and present technical reports.

CO5: Acquire a basic knowledge of various. job oriented communication skills.

LANGUAGE LABORATORY:

[to be evaluated for Continuous Evaluation (CE): 30 marks]

Objectives of the Practical Course:

1. Practical classes in the Language Lab on sounds of English language, its word stress and intonation and on the silent letters in English words attempt to neutralize the learner's accent drawing their attention to the wrong pronunciation commonly made by the non-native speakers while interacting in English and facilitate them to do better in telephonic interviews conducted in English and have good intelligibility between them and the teachers when they go abroad for higher studies in the medium of English language.
2. Practical classes on Communicative English, Essential English Grammar, Building Vocabulary, Common Errors in English and Reading and Listening exercises attempt to introduce the learners to speech mannerism both formal and informal, strengthen their grammatical knowledge of English, enrich their word stock, make them aware of common mistakes made by non- native speakers while interacting in English and develop their reading, comprehension and listening skills.
3. Interactive sessions in the lab such as Presentation, Group Discussion, JAM, Role Playing and Describe People/Object/Place work as ice-breaking activities, participation in which enables the students to overcome their inhibitions while speaking; invigorate their presence of mind; enhance their critical focus; boost their confidence level; develop their team spirit, leadership quality and problem solving ability; hone their presentation skill and assist them to have effective communication in English (both verbal and non verbal) and be skilled in time management.
4. Writing home assignments with the aid of given guidelines gives the students the scope to enhance their writing skills in English and become aware of various societal issues and problems.
5. The Practical Course aims to develop the communicative skills of the students in English and make a growth of different facets of their personalities to enable them to fare better and have dynamic sustenance in today's academic, social and professional lives.

Syllabus:

Unit – I

Computer/ software aided lessons for practical classes: Contact Hours: 28

- Pronunciation: Vowels, Diphthongs and Consonants sounds, Stress and Intonation and Silent Letters in English words.
- Communicative English - Exercises on situational dialogues/ role play in both formal and informal contexts.
- Essential English Grammar
- Building Vocabulary – synonyms, antonyms and phrases and idioms
- Common Errors in English
- Developing reading, comprehension and listening skills with the aid of language lab devices of reading and listening exercises.

Unit – II

Activities/ Interactive sessions for practical:

- Paper Presentation (Manuscript/ Power Point) **Contact Hours: 20**
- Group Discussion
- Just a Minute' Session (JAM)
- Role Playing
- Describing Object/People/Place.

Unit – III

Home Assignments:

- Each student has to submit two home assignments following the guidelines given with a view to enhance their writing skills as well as make them aware of various ethical and environmental issues, social problems, current affairs etc. on the topics of which the writings are to be submitted.

Books recommended in addition to the software installed in the systems with the objective to add to the students' knowledge of the different units of the syllabus and to aid them in interactive sessions:

- Marks, Jonathan. *English Pronunciation in Use: Elementary*. Cambridge: CUP, 2009.
- Hewings, M. *English Pronunciation in Use. Advanced*. Cambridge: CUP, 2009.
- Rottanji. *A Book on Silent Letters in English*. Web
- *English Language Communication Skills (ELCS) Lab Manual- cum-Work Book*. New Delhi: Cengage Learning India Pvt., 2013.
- Murphy, Raymond. *Essential English Grammar: A Self Study Reference and Practice Book for Elementary Students of English 2nd edition*. Cambridge: CUP.

- Hewings, Martin. *Advanced English Grammar: A Self Study Reference and Practice Book for Advanced South Asian Students*. Cambridge: CUP.
- Merriam-Webster. *The Merriam-Webster Dictionary of Synonyms and Antonyms*. US: Merriam-Webster.1984.
- Gulland, Daphne M and David G. Hinds- Howell. *Dictionary of English Idioms 2nd Revised Edition*. UK: Penguin. 2001.
- Kumar, Sanjay and Pushp Lata. *Communication Skills, Second Edition*. OUP. 2015.
- Chin, Peter, Samuel Reid et al. *Academic Writing Skills Student's Book 2*. Cambridge: CUP.
- Cholji, Mark. *Towards Academic English: Developing Effective Writing Skills*. Cambridge: CUP.
- *Spoken English* (CIEFL) in 3 volumes with 6 cassettes, OUP.

Course Code	Course Title	Hours per week L-T-P	Credit C
CY181211	Chemistry-201 Lab	0-0-2	1

List of Experiments:

Choice of 6 experiments from the following:

1. Determination of surface tension of a given liquid at room temperature by Stalagmometer.
2. Determination Co-efficient of viscosity of a given liquid at room temperature by Ostwald's Viscometer.
3. Measurement of conductivity of an Electrolyte.
4. Determination of pH of strong and weak acid & bases by using pH meter.
5. Determination of available chlorine in bleaching powder.
6. Determination of total hardness of water by EDTA method.
7. Estimation of percentage of copper in brass sample.
8. Estimation of iron.
9. Salt analysis.
10. Separation of components of a mixture by paper chromatography.

Reference books

1. Vogels text book of quantitative inorganic analysis, revised by J. Bassett, R.C. Denny, G.H.Jeffery, 4th Ed.
2. Practical Engineering chemistry by Sunitha and Rathna.

Course Outcome

The chemistry laboratory course will consist of experiments illustrating the principles of chemistry relevant to the study of science and engineering. The students will be able to:

CO1: to measure molecular/system properties such as surface tension, co-efficient of viscosity, conductivity of electrolyte, pH of acid and bases, available chlorine content in bleaching powder, hardness of water, copper content in brass, estimation of iron etc.

CO2: to get expose for analysis of basic radicals qualitatively in given salt mixture

CO3: to expose the students to the students to the paper chromatography technique for detection of components from a mixture of components.

Course Code	Course Title	Hours per week L-T-P	Credit C
EE181117	Basic Electrical Engineering Lab	0-0-2	1

List of Laboratory Experiments/Demonstrations:

1. Basic safety precautions, Introduction and use of measuring instruments.
2. Calibration of measuring instruments.
3. Verification of Thevenin's Theorem.
4. Verification of Maximum Power Transfer Theorem.
5. Measurement of power in a single phase AC circuit using Wattmeter.
6. Measurement of circuit parameters under steady-state condition for RLC circuits.
7. Demonstration of cut-out sections of Electrical Machines.
8. Characteristics of incandescent lamp.
9. Study of balanced three phase circuits.
10. Demonstration of layout of house wiring.
11. Demonstration of measurement of insulation resistance.

7. Abhijit Chakrabarti, Sudipta Nath and Chandan Kumar Chanda, —Basic Electrical Engineering, Tata McGraw-Hill, 2017

Course Outcome: On successful completion of the course, the students will be able to:

CO1: be familiar with switching on and taking precautionary measures while handling electrical equipment.

CO2: apply knowledge of different types of electrical circuits, components and instruments to relate theoretical concepts with experimentation.

CO3: organize and write an engineering report including graphs and tables after performing an experiment

Course Code	Course Title	Hours per week L-T-P	Credit C
ME181216	Workshop	0-0-4	2

1. Lathe:

(a) **Lathe** – Functions, Classification and Specification, Different parts, Drive mechanisms for speed, feed, depth of cut, Taper turning, other operations, Machining time. Lathe accessories and Attachments.

(b) **Semi-Automatics** – Capstan and Turret Lathes – Different parts – Tools – Work and Tool holding devices. Indexing and Bar Feeding mechanism, Tool layout and Tool schedule chart.

2. Shaper, Planar, Slotting and Broaching Operations

(a) **Shaper** - Function, Classification and Specification, Different part of a shaper – Quick return and feed mechanism – Shaper Operations, Cutting speed and Machining time calculations.

(b) **Planar** - Function, Classification and Specification, Difference between shaper and planar - Table drives and field mechanism – Planar operations – Machining time.

(c) **Broaching** – Purpose, Broaching tool and machine

(d) **Slotting Machine** – Purpose, Slotting tool and machine.

3. Drilling:

(a) Drilling machines – Classification – Specification – Parts drilling machine – Spindle drive mechanism – tool and work holding devices.

(b) Types of Drills and twist drill nomenclature, drill size and designation of drills.

(c) Deep hole drilling operation.

(d) Speed, feed and depth of cut and machining time in drilling.

(e) Reaming operation, Reaming tools, Reaming allowances.

(f) Tapping operation, tap drill size, difference with die (solid and adjustable).

4. Milling:

Introduction – Classification – Principal parts of a column and knee type Milling machine – Specifications, Spindle drive and feed mechanism, elements of a milling cutter, Milling processes – Up Milling – down milling – face milling – end milling, cutting speed, feed and depth of cut – machining time, indexing and dividing head, indexing methods, spur and helical gear milling operations – Selection of cutter for gear cutting.

5. Grinding:

Introduction – Kinds of Grinding – Grinding processes – Centerless Grinders – Surface Grinders – Tool and cutter Grinder – Specification Grinding wheel – Abrasives – Bonding Processes – Grid, Grade and Structure – Marking System of Grinding wheel – Selection of Grinding wheel, Mounting, Dressing, Truing and Balancing of grinding wheel.

6. Pattern making and Foundry:

Pattern making and sand casting – Pattern materials – Types – Pattern allowances, Coreprints, Moulding sand – Ingredients – Classification – Sand additives – Properties of Moulding sand – Sand preparation and testing, Green sand mould preparations, Cores and core making – Types of Cores.

BOOKS:

1. Elements of Workshop Technology – Vol. I and II, S.K. Hajra Choudhury and A.K. Hajra Choudhury.
2. A course in Workshop Technology (Vol. I and Vol. II) – B.S, Raghuwanshi.
3. Manufacturing Technology – P.N. Rao – Tata McGraw Hill.
4. Workshop Technology – I – P.K. Sapra and R.K. Kapur – Bikas Publishing.
5. Elements of Manufacturing Processes – B.S. Nagendra Parasar and R.K. Mittal – PHI
6. Introduction to Machining Science – G.K. Lal, New Age International Ltd.

Course Outcome: After successful completion of the course, the students will be able to:

CO1: Demonstrate the different types, working principle, different operations and attachments of lathe and semi-automatic lathe.

CO2: Differentiate the different types along with parts, mechanisms and operations of shaper, planar, broaching and slotting machines

CO3: Differentiate the different types of drilling machines, drills and reamers along with the different operations

CO4: Explain the different types of milling machines, milling cutters, along with milling operations

CO5: Explain the basic principles of grinding, different types of grinding machines, grinding operations, specifications, dressing and truing of grinding wheels.

Detailed Syllabus:

Course Code	Course Title	Hours per week L-T-P	Credit C
MA181301A	Mathematics III-A (for branches other than CSE and ECE/ETE)	2-1-0	3

MODULE 1: Partial Differential Equation: (15 Hours)

Formation of Partial Differential equations, Linear partial differential equation of first order, Non-linear partial differential equations of first order, Charpit's method, Method of separation of variables, boundary value problem with reference to the one dimensional heat and wave equation.

MODULE 2: Probability Theory: (15 Hours)

Review of basic probability and Bayes' theorem, Probability distribution, Binomial, Poisson and normal distribution, Joint distribution, Test of significance, fitting of straight line by least square method, Elementary concept of Markov Chain.

MODULE 3: Laplace Transform: (10 Hours)

Laplace transform of elementary function, Properties of Laplace transform, inverse Laplace transform, convolution theorem, Solution of ordinary differential equations with the help of Laplace transform.

Textbooks/References:

1. Advanced Engineering Mathematics: Erwin Kreyszig
2. Higher Engineering Mathematics: B V Ramana
3. Theory and problems of Probability: Seymour Lipschutz
4. A text book of engineering Mathematics: N. P. Bali & M. Goel
5. Statistical Methods: An Introductory Text- J.Medhi, New Age International Publishers

Course Code	Course Title	Hours per week L-T-P	Credit C
EE181302	Electrical Circuit Analysis	3-1-0	4

Pre-requisite: Knowledge of basic electrical engineering

Course Objectives:

- To impart the basic knowledge about various elements of electric circuits.
- To inculcate the understanding about application of Network Theorems for solving circuits and modelling circuits using matrix representation.
- To understand network topology, transient phenomenon and two port networks.
- To be able to apply various techniques of networks synthesis from network functions.

Course Outcomes:

At the end of the course, the students will be able to

CO1:

Apply appropriate laws of various circuit elements to develop mathematical models, detailing their constructional features and their applications.

CO2:

Make use of various network theorems to evaluate variety of networks and to model given networks using appropriate matrix representation amenable to various types of network analysis.

CO3:

Model networks using elementary graph theory and to analyse given networks for their transient response.

CO4:

Utilize the concept of two port networks, their characteristics and mode of interconnection to evaluate various networks.

CO5: Synthesize networks from various network functions like admittance and impedance functions.

MODULE 1: Elements of electric circuits:

(5 Lectures)

resistor: Practical engineering devices. Solid & wire frame of common resistive materials, carbon film and metal film resistors. Heat dissipating area (wattage), tolerance and temperature stability of resistors. Mathematical models, the capacitor: Comparison of properties of different traditional & modern dielectric materials (e.g. paper, ceramic, polystyrene polycarbonates etc.) Short description of electrolytic capacitor- wet & solid dielectrics, solid tantalum & aluminium capacitors, Mathematical models, the inductors: Mutual inductance, Properties of core materials.

Brief studies of iron & ferrite cores, Mathematical models (only assignments).

MODULE 2: Network theorems: (8 Lectures)
Millman's theorem, Reciprocity theorem, Compensation & Tellegen's, etc. Analysis of coupled circuits. The dot rule & equivalent conductivity coupled forms of magnetically coupled circuits.

MODULE 3: Methods for the solution of circuit equations: (4 Lectures)
Analysis of electrical network with – independent/dependent ideal, practical current voltage and current sources – both of DC and AC. Solution of network equations by matrix methods.

MODULE 4: Network topology: (5 Lectures)
Elementary graph theory as applied to electrical networks. Matrices of graph: Incidence matrix, circuit matrix, cut set matrix. Advanced techniques of equation formulation for numerical solutions.

MODULE 5: Transient phenomenon: (7 Lectures)
Forcing functions-impulse, step and ramp functions Study and solution of simple circuits undergoing transient disturbances, A.C. transients, Time domain equations and solutions by Laplace transforms

MODULE 6: Two port Network: (7 Lectures)
General principles, ABCD, Z, Y and hybrid parameters, Analysis of networks in tandem. Transmission lines. Lumped and distributed models. Combination/Interconnection of two ports network.

MODULE 7: Introduction to Network Synthesis: (9 Lectures)
Realizability of networks, positive real function (PRF) and its properties, Hurwitz polynomial, Routh-Hurwitz Array, properties of various immittance functions (LC, RC, RL), Foster and Caur forms of realization of network for given driving point impedance/admittance function.

Text Books:

1. Basic Electrical Engineering—A Chakravarti, S Nath, C K Chanda, Tata Mcgrawhill, 2017
2. Network Analysis and Synthesis—Smarajit Ghosh, PHI, First Edition
3. Electric Circuit----J.A. Edminiter. (Mcgraw hill)
4. Networks and Systems ---D Roychowdhury, New Age International Publications, 1998
5. A course in Electric Circuit Analysis—Soni & Gupta

Reference Books:

1. Computer aided Network Design—Donald A. Calahan (Tata Mcgraw hill)
2. Engineering Circuit analysis---- W. H. Hayt Jr. & J.E. Kemmerly (Mcgraw hill)
3. Network Analysis---M E Van Valkenburg, PHI, 2006
4. Electric Circuits----C K Alexander and M N O Sadiku, McGraw Hill Education ,2004

Course Code	Course Title	Hours per week L-T-P	Credit C
EE181303	Analog Electronics	3-0-0	3

Course Objectives:

- To teach the basic concept and applications of various analog electronic devices and circuits.
- To develop problem formulation and problem solving ability amongst the students.

Course Outcomes: At the end of this course, the students will be able to

CO1:

Identify and analyze various types of diodes and their applications.

CO2:

Characterize and analyze the performance and applications of BJTs and FETs.

CO3:

Analyze the performance of cascaded amplifiers.

CO4:

Analyze the effects of Negative and Positive Feedback on amplifiers.

CO5:

Analyze and design basic OPAMP applications.

MODULE 1: The P-N Junction:

(8 Lectures)

Charge Flow Description and Energy Band Description of P-N Junction. Shockley's Equation. Resistance and Capacitances associated with a P-N Junction. Piecewise linear model of Diode. Effect of temperature.

Practical applications of diodes, Rectifiers and Filters, Clippers, Clampers, Voltage Multipliers.

Special Purpose Diodes- Zener Diode, LED, Photo-Diode, Varactor Diode, Tunnel Diode, Schottky Diode.

MODULE 2: Bipolar Junction Transistor:

(12 Lectures)

Construction and Principle of operation of BJT. Transistor Action. Transistor Current Equations, ' α ' and ' β ' parameters. Transistor Characteristics. Early Effect. Ebers-Moll Model and Justification of Transistor Characteristics. Concept of Amplification and Switching Action. Transistor Biasing Circuits. Stability of operation and Stability Factor

Small signal r_e -parameter model and h-parameter model of the BJT. Introduction to π - model. Analysis of amplifiers with small signal models. Current Gain, Voltage Gain, Power Gain, Input Impedance and Output Impedance. Introduction to Miller's Theorem. Cascaded Amplifier. Coupling between stages, Frequency Response and Band Width of an amplifier.

Darlington Connection, Cascode Connection and Difference Amplifier Connection of Transistors.

MODULE 3: Field Effect transistors, JFET and MOSFET: (5 Lectures)

Basic construction and physical behaviour of JFET and MOSFET. Study of current flow through JFET and MOSFET. JFET and MOSFET Characteristics- Drain Characteristics and Transfer Characteristics. Biasing circuits for JFET and MOSFET. Small Signal Model of JFET. Analysis of JFET amplifier.

JFET and MOSFET switches.

MODULE 4: Effect of Negative and Positive Feedback in Amplifiers: (5 Lectures)

Effect of Negative Feedback in amplifiers and its advantages. Analysis of different feedback configurations.

Positive Feedback. Barkhausen Criteria for oscillation. Analysis of RC Oscillator, LC Oscillator and Crystal Oscillator.

MODULE 5: Integrated Circuit Electronics: (10 Lectures)

Internal Circuit Diagram of OPAMPs, TTL Gates and CMOS Gates.

Functional Block Diagram and Ideal Characteristics of OPAMP, Open-Loop Gain, Input and Output Impedance, Bandwidth, CMRR, Slew Rate, Input Offset Voltage and Current.

Closed Loop application of OPAMP, - Non-Inverting and Inverting Configurations. Concept of Virtual Ground. Non-inverting and Inverting Amplifiers. Adders, Subtractors, Difference Amplifiers and Instrumentation Amplifier. Integrators and Differentiators. Log Amplifier. OPAMP Sinusoidal Oscillators.

Non-Linear Applications – Comparator, Schmitt trigger, Zero Crossing Detector, A stable Multivibrator.

Active Filters, LPF, HPF, BPF and Notch Filters.

Introduction to Timer IC 555 and its applications.

Textbooks/References:

1. Integrated Electronics - Millman & Halkias (PHI).
2. OPAMPs and Linear Integrated Circuits- Ramakant A. Gayakwad (PHI)
3. Electronic Devices and Circuits – David J Bell. (Oxford)

Course Code	Course Title	Hours per week L-T-P	Credit C
EE181304	Electrical Machines-I	3-1-0	4

Prerequisites:

- Basic knowledge of electrical and magnetic circuits and electromagnetic induction

Objectives:

To give an idea about the principle of operation, working and performance of D.C. machines and transformers

Course Outcomes: At the end of the course, the students will be able to:

CO1:

Understand the principles of electromagnetic energy conversion and electromagnetic induction

CO2:

Understand the principles of operation and construction of D.C. machines (both motors and generators) and transformers

CO3:

Analyze the various characteristics of D.C. generators and D.C. motors, and various connections of three-phase transformers

CO4:

Interpret the necessary conditions to be satisfied for parallel operation of D.C. Generators and single phase and three phase transformers

CO5:

Evaluate the performances of DC machines and transformers by carrying out various tests on them

MODULE 1: (i) Electromagnetic Induction (2 Lectures)
(ii) Electromechanical Energy Conversion (2 Lectures)

Review of magnetic circuits, MMF, Electromagnetic induction, magnetically induced e.m.f., Magnetically coupled circuits

Basic principles of energy conversion, Field magnets, Dynamically induced e.m.f. and torque in rotating machines

MODULE 2: D.C. Machines

(i) Generators: (12 Lectures)

Constructional features, Details of Armature windings, Methods of excitations-shunt, series and compound. E M F equation, Armature reaction, Inter-poles and compensatory windings, Commutation, Characteristic of generators, Efficiency and Regulation, Parallel operation

(ii) Motors: (8 Lectures)

Torque equation of motors, Speed and Torque characteristic curves of shunt, series and compound motors, Starting of D C motors – Starters and grading of starting resistance, Speed control-

conventional methods and solid state control, Choice of motors for different duties, Losses and efficiency, Testing – Swinburne’s test, Back to back test, Retardation test and Brake test.

MODULE 3: Transformers:

(8 Lectures)

Principles of operation of transformer, voltage and current ratios, Construction – shell type and core type, single phase and poly phase cooling methods, E.m.f. equation and output equation, Magnetic circuit, leakage flux and leakage reactance, Phasor diagram, per unit values of resistance and reactance, Open circuit and short tests, back to back test, Regulation, losses and efficiency, maximum efficiency, all-day efficiency, Auto-transfer, 3-phase transformer, Phase transformation and connections. Parallel operation of transformers, Vector grouping, Harmonics.

Text Books:

1. Nagrath D.P. & Kothari I.J, " Electrical Machines", Tata McGraw Hill Education
2. Bimbra, P.S., "Electric Machinery", Khanna Publishers
3. Mehta V.K. and Mehta, R. "Principle of Electrical Machines", S. Chand and Co.

Reference Books:

1. Langsdorf A.S: Theory of Alternating Current Machinery, McGraw Hill Education
2. Chapman.J, “Electric Machinery Fundamentals”, McGraw Hill Book Co.
3. Fitzgerald, A.E., Charles Kingsely Jr. Stephen D. Umans, “Electric Machinery” McGraw Hill Books Company
4. J.B. Gupta, "Theory & Performance of Electrical Machines" Katsons Books

Course Code	Course Title	Hours per week L-T-P	Credit C
EI181305	Digital Electronics	3-0-0	3

Prerequisites: Basic idea of Electrical and electronics circuits

Course Objectives:

- To understand number representation and conversion between different representation in digital electronic circuits.
- To understand and implement logical operations using combinational logic circuits.
- To understand and implement logical operations using sequential logic circuits.
- To understand characteristics of memory and their classification.

Course Outcomes:

At the end of this course, the students will be able to

- CO1:** Perform conversion of n-bit codes from one form to another form.
- CO2:** Design a logical circuit using the minimum number of gates for a given logical expression.
- CO3:** Use and demonstrate a given digital combinational circuit.
- CO4:** Use different types of flip-flops and design a sequential logic circuit.
- CO5:** Design ROM, RAM and PLA for a given application.

MODULE 1: Number system (4 Lectures)

Representation of Binary numbers, octal and hexadecimal numbers, complements, signed binary numbers, Binary codes, code conversion, floating point numbers and arithmetic and the conversion process.

MODULE 2: Boolean algebra and logic gates (4 Lectures)

Basic theorems and properties of Boolean algebra, Boolean functions, canonical and standard forms-SOP & POS. Logical operations, truth tables, logic gates, logic levels and pulse waveforms.

MODULE 3: Simplification of Boolean functions (6 Lectures)

The map method- the Karnaugh map, minimal SOP & POS, Don't care conditions, multiple output minimization, tabular method, Quine-Mcclusky method, determination and selection of prime implicants.

MODULE 4: Combinational Logic circuits (9 Lectures)

Introduction: Logic synthesis: Introduction, universal property of NAND and NOR gates, AND-OR networks, NAND & NOR networks, EX-OR networks.

Adders & subtractors, parallel binary adders, magnitude comparator, decoders & encoders, Multiplexer & demultiplexers, parity generators & checkers. ROM, RAM and PLA.

MODULE 5: Sequential Logic Circuits**(9 Lectures)**

S-R, J-K, D and T Flip Flops, Excitation table, Triggering of FFs & Latches, one shot A stable Multivibrator. Registers: - Shift – Registers, Ripple Counters, Synchronous Counters. Ring Counters, Timing Sequences, Design Procedure.

MODULE 6: Digital integrated Circuit**(4 Lectures)**

Introduction, special characteristics (Fan-Out, Power dissipation, Propagation delay, figure of merit, noise level) Introduction to TTL, ECL, MOS, and CMOS circuit.

MODULE 7: A/D and D/A converters**(4 Lectures)**

Introduction and examples of ADC and DAC circuits.

Text Books:

1. Digital Design – M. Marris Mano.
2. Logic Design Theory – NN Biswas
3. Digital Fundamental – TL Floyd
4. Digital Electronics- R. P. Jain.

Reference Books:

1. Logic Design Theory – NN Biswas
2. Digital Fundamental – TL Floyd

Course Code	Course Title	Hours per week L-T-P	Credit C
MC181306	Constitution of India	2-0-0	0 (PP/NP)

Course Objectives: Students will be able to:

1. Understand the premises informing the twin themes of liberty and freedom from a civil rights perspective.
2. To address the growth of Indian opinion regarding modern Indian intellectuals' constitutional role and entitlement to civil and economic rights as well as the emergence of nationhood in the early years of Indian nationalism.
3. To address the role of socialism in India after the commencement of the Bolshevik Revolution in 1917 and its impact on the initial drafting of the Indian Constitution.

Course Outcomes: Students will be able to:

1. Discuss the growth of the demand for civil rights in India for the bulk of Indians before the arrival of Gandhi in Indian politics.
2. Discuss the intellectual origins of the framework of argument that informed the conceptualization of social reforms leading to revolution in India.
3. Discuss the circumstances surrounding the foundation of the Congress Socialist Party [CSP] under the leadership of Jawaharlal Nehru and the eventual failure of the proposal of direct elections through adult suffrage in the Indian Constitution.
4. Discuss the passage of the Hindu Code Bill of 1956.

MODULE 1: History of Making of the Indian Constitution:

- a) History
- b) Drafting Committee, (Composition & Working)

MODULE 2: Philosophy of the Indian Constitution:

- a) Preamble
- b) Salient Features

MODULE 3: Contours of Constitutional Rights & Duties:

- a) Fundamental Rights
- b) Right to Equality
- c) Right to Freedom
- d) Right against Exploitation
- e) Right to Freedom of Religion
- f) Cultural and Educational Rights
- g) Right to Constitutional Remedies Directive Principles of State Policy Fundamental Duties.

MODULE 4: Organs of Governance:

- a) Parliament
- b) Composition
- c) Qualifications and Disqualifications
- d) Powers and Functions
- e) Executive
- f) President
- g) Governor
- h) Council of Ministers
- i) Judiciary, Appointment and Transfer of Judges, Qualifications
- j) Powers and Functions

MODULE 5: Local Administration:

- a) District's Administration head: Role and Importance,
- b) Municipalities: Introduction, Mayor and role of Elected Representative CEO of Municipal Corporation.
- c) Panchayati raj: Introduction, PRI: Zila Panchayat.
- d) Elected officials and their roles, CEO Zila Panchayat: Position and role.
- e) Block level: Organizational Hierarchy (Different departments),
- f) Village level: Role of Elected and Appointed officials,
- g) Importance of grass root democracy

MODULE 6: Election Commission:

- a) Election Commission: Role and Functioning.
- b) Chief Election Commissioner and Election Commissioners.
- c) State Election Commission: Role and Functioning.
- d) Institute and Bodies for the welfare of SC/ST/OBC and women.

Textbooks/References:

1. The Constitution of India, 1950 (Bare Act), Government Publication.
2. Dr. S. N. Busi, Dr. B. R. Ambedkar framing of Indian Constitution, 1st Edition, 2015.
3. M. P. Jain, Indian Constitution Law, 7th Edn., Lexis Nexis, 2014.
4. D.D. Basu, Introduction to the Constitution of India, Lexis Nexis, 2015.

Course Code	Course Title	Hours per week L-T-P	Credit C
EI181313	Analog Electronics Lab	0-0-2	1

Course Objectives:

1. To understand the basic concept of various electronic devices, circuits and their application.
2. To develop ability among students to design and implement electronic circuits.

Course Outcomes:

After completing this course, the students will be able

1. To determine the dc and ac parameters of semiconductor devices.
2. To analyze the performance of different types of rectifier with and without filter.
3. To plot frequency response of BJT and JFET amplifier.
4. To analyze effect of negative and positive feedback on the performance of amplifier.

LIST OF EXPERIMENTS

1. Study of Rectifier and Filter
2. Common Base Characteristics and Evaluation of H-Parameters.
3. Common Emitter Characteristics and Evaluation of H- Parameters.
4. Study of R-C Coupled Common Emitter Amplifier and Effect of Feedback.
5. Study of JFET Characteristics and Common Source Amplifier.
6. Study of OPAMP Inverting and Non-Inverting Amplifiers.
7. Study of OPAMP Summing and Difference Amplifiers and Instrumentation Amplifier.
8. Study of OPAMP Phase-Shift Oscillator and Wien Bridge Oscillator.
9. Study of OPAMP Active Filters.
10. Study of Non-Linear Opamp Applications.

Course Code	Course Title	Hours per week L-T-P	Credit C
EI181314	Electrical Machines-I Lab	0-0-3	1.5

Course Objectives:

The Electrical Machines-I Laboratory is designed to provide the students with the practical knowledge of electrical machines specifically keeping in view the following objectives:

1. to get hands-on experience in performing the basic tests on electrical machines
2. to reinforce the theoretical concepts with related practical understanding
3. to know about the various precautionary measures necessary in handling electrical machines
4. to develop technical report writing skill

Course Outcome:

After completing this course, the students will

CO1:

be familiar with the mode of starting, switching-off, and taking precautionary measures while handling electrical machines

CO2:

be able to reinforce their theoretical concepts by way of experimentation

CO3:

develop report writing skill

LIST OF EXPERIMENTS

1. O.C.C. of D.C. generators
2. Load Test on D.C. shunt generators
3. Speed Control of D.C. shunt motors
4. Open circuit and short circuit test on single-phase transformers
5. Load test on single-phase transformers
6. Sumpner's Test or back-to-back test on two similar single-phase transformers
7. Three-phase Transformer Connections
8. Hopkinson's or Back-to-back test on two similar D.C. Machines

Course Code	Course Title	Hours per week L-T-P	Credit C
EI181315	Digital Electronics Lab	0-0-2	1

Course outcomes:

At the end of the course, the students will be able to:

CO1:

verify and analyze the outputs of combinational logic circuits and relate theoretical concepts with experimental analysis.

CO2:

verify and analyze the outputs of sequential logic circuits and relate theoretical concepts with experimental analysis.

CO3:

organize and write an engineering report after performing an experiment on digital circuits.

LIST OF EXPERIMENTS

1. Realization of basic gates by using universal gates
2. Realization of XOR gate
3. Combinational Logic Design using 74xx ICs
4. Arithmetic Circuit- construction and testing using 74xxICs: Half/Full Adder
5. Construction of 1- bit comparator using 74xxICs.
6. code converters – Binary to Gray & Gray to binary.
7. Verification of Truth Table of SR Flip-Flop
8. Verification of Truth Tables of JK, D, T Flip-Flops
9. 3-Bit synchronous counter design
10. Decade Counter design

- N.B. 1. MC181406 is a Mandatory Audit Course (No Credit). It will be evaluated as PP (Pass) or NP (Not Pass)**
- 2. 2-3 weeks Mandatory Academia Internship need to be done in the 4th semester break and the report is to be submitted and evaluated in 5th semester**

Detail Syllabus:

Course Code	Course Title	Hours per week L-T-P	Credit C
EI181401	Electrical Measurements	3-1-0	4

Prerequisites:

- Higher School Physics
- Higher School Mathematics
- Basic concept of Electrical Engineering

COURSE OBJECTIVES:

- Explanation of fundamental measuring concept in various measuring instruments and their practical applications in Electrical Engineering and Instrumentation Engineering fields.

COURSE OUTCOMES:

At the end of this course, the students will be able to

CO1:

Students will be able to understand the basic concept of static and dynamic characteristics of an instrument and along with that they will be able to identify different types of measuring instruments.

CO2:

Students will be able to describe the working principle of different types of instruments along with their applications in electrical engineering field.

CO3:

Students will be able to compute electrical voltage, current, power, power loss, energy, frequency, power factor, flux density, iron loss, permeability etc. and physical parameters like pressure, flow speed etc. using different types of instruments and methods.

CO4:

Students will be able to compute the electrical parameters (R, L, C, frequency etc.) using DC and AC Bridge with the help of different methods

CO5:

Students will be able to understand the working principle, construction and applications of an instrument transformers and the potentiometer.

MODULE 1: Characteristic of Instruments and Measuring Systems (2 Lectures)

Static characteristic – accuracy, sensitivity, reproducibility, drift, static error and dead zone. Dynamic characteristic- response to step and sinusoidal signals. Errors occurring in measurement.

MODULE 2: Measuring Instruments (6 Lectures)

Electro-dynamic, rectifier and induction type ammeters and voltmeters – construction, operation, errors and compensation, Electro-dynamic and induction type watt meters, Single phase induction type energy meter. MC and MI type power factor meters. Electrodynamometer type frequency meter, Synchroscope. Digital Voltmeters and Ammeters, Digital Wattmeters and Energy Meters Electro-dynamic, rectifier and induction type ammeters and voltmeters – construction, operation, errors and compensation, Electro-dynamic and induction type watt meters, Single phase induction type energy

meter. MC and MI type power factor meters. Electrodynamometer type frequency meter, Synchroscope. Digital Voltmeters and Ammeters, Digital Wattmeters and Energy meters.

MODULE 3: Sensors and Transducers

(3 Lectures)

Sensors and Transducers for physical parameters: temperature, pressure, torque, flow, Speed and Position Sensors; Hall Sensors.

MODULE 4: Measurement of Resistance

(4 Lectures)

Wheatstone bridge method – sensitivity of the Wheatstone Bridge – precautions to be taken while making precision measurements, Limitations, Carey-Foster slid Wire Bridge.

Measurement of low resistance – Kelvin’s Double Bridge.

Measurement of high resistance – direct deflection method. Measurement of volume and surface receptivity. Loss of charge method. Measurement of insulation resistance with power on.

MODULE 5: Potentiometers

(5 Lectures)

D. C. potentiometer – basic principle. Laboratory type potentiometer. Methods of standardization. Applications- calibration of ammeters and voltmeters, measurement of resistance and power - calibration of watt meters. Volt ratio box, A. C. potentiometers – difference between A. C. and D. C. potentiometers. Types - polar and co-ordinate type. Application of A. C. potentiometer.

MODULE 6: A. C. Bridge

(4 Lectures)

General principle, Balance equation. Sources and Detectors used in A. C. Bridges. Balance condition and Phasor diagrams of Maxwell’s bridge, Anderson’s bridge, Owen’s bridge, De Sauty’s bridge, Low voltage Schering Bridge, Heavy-side mutual inductance Bridge.

MODULE 7: Magnetic Measurement

(3 Lectures)

Magnetic hysteresis, alternating current magnetic testing, separation of iron losses. Measurement of iron losses by the watt meter method, Cambell’s bridge method and the Oscillo graphic method.

MODULE 8: Instrument Transformer

(5 Lectures)

Use of instrument transformers – ratio, burden. Theory and operation of CTs and PTs – errors and compensation – CT testing – mutual inductance method, Silbee’s method. PT testing – comparison method. Power and energy measurement using CTs and PTs. Effect of reverse polarity connection of one of the CTs on 3-phase energy meter.

MODULE 9: C.R. O

(2 Lectures)

Basic construction, main parts, principle of operation, Applications.

Text Books:

1. Golding and Widdis – Electrical Measurements and measuring instruments. AH WHEELER & Company
2. A.K. Sawhney – Electrical and Electronic Measurements and Instrumentation Dhanpat rai & Co

Reference Books:

1. Electronic Instrumentations H.S. Kalsi
2. Electrical Measurement and Measuring Instruments by U.A Bakshi, A.V. Bakshi

Course Code	Course Title	Hours per week L-T-P	Credit C
EI181402	Control Systems	3-1-0	4

Prerequisites: Laplace transforms techniques

COURSE OBJECTIVES:

- To introduce the fundamental concepts of control systems
- To study the time domain analysis of control systems
- To study the stability of control systems

COURSE OUTCOMES:

At the end of this course, the students will be able to

CO1: Define, classify and compare different types of control systems

CO2: Derive transfer function of control systems

CO3: Analyze and determine the time response of control systems

CO4: Analyze stability of control systems using analytical and graphical techniques

CO5: Apply analytical and graphical techniques to design control systems

MODULE 1: Elementary Concepts of Control Systems

Definition, open loop and closed loop systems, definitions and examples of linear, non-linear, time-invariant and time variant, continuous and discrete control system, block diagram representation of control systems.

MODULE 2: Models of Physical Systems

Transfer function: definition and properties, poles, zeros and pole-zero map, formulation of differential equations for physical systems and derivation of transfer function: mechanical and electrical systems, derivation of transfer function using block diagrams reduction techniques and signal flow graphs, signal flow graph from block diagram, analogous systems.

MODULE 3: Introduction to Control System Components

Error detectors, rotary potentiometers, servomotors, tacho-generators, servo amplifiers and determination of transfer functions.

MODULE 4: Time Domain Analysis:

Concept of transient response and steady-state response, standard test signals - step, ramp, parabolic and impulse signals, time response of first order and second order systems, closed loop transfer function, characteristic equation, performance specifications in time domain, derivative and integral control and their effects on the performance of the 2nd order systems, system types and error constants, generalized error coefficients, transient response of higher order systems (outline only).

MODULE 5: Stability Analysis

Concepts of control system stability, relation between stability and pole locations, Routh-Hurwitz stability criterion, scopes and limitations of the criterion, root-locus techniques, system analysis and design using root-locus technique.

MODULE 6: Frequency Response Analysis

Frequency response and its specifications, stability analysis using frequency response plots: Bode plot, polar plot, log-magnitude vs phase plots, Nyquist plot and Nyquist stability criterion, M and N circle.

MODULE 7: Compensation Techniques

Preliminary design specifications in time and frequency domain, gain compensation, lead and lag compensation.

Text Books:

1. Nagrath and Gopal: Control Systems Engineering
2. K Ogata: Modern Control Engineering

Reference Books:

1. B Kuo: Automatic Control Systems
2. A Anand Kumar: Control Systems
3. Salivahanan, Rengaraj and Venkata krishnan: Control Systems Engineering
4. Gibson and Teylor: Control System Components

Course Code	Course Title	Hours per week L-T-P	Credit C
EE181403	Electrical Machines -II	3-1-0	4

Course Outcomes:

At the end of the course, the student will be able:

CO1:

To apply the knowledge of electro-magnetic to explain the working of an induction motor.

CO2:

To apply the knowledge of equivalent circuit, basic equations for determination of torque, power and efficiency and to perform laboratory test for determination of motor parameters.

CO3:

To analyze the performance of induction motors based on their control and applications.

CO4:

To have the knowledge of working principles of alternators and their role in electrical power generation

Also, they will know about the characteristics of synchronous motors and their applications.

CO5:

To have knowledge of principle of operation of various motors, such as universal motor, repulsion motor, reluctance motor, stepper motor and BLDC motor, and their field of applications.

MODULE 1: Fundamentals of AC Machine Windings

(7 Lectures)

Physical arrangement of windings in stator and cylindrical rotor; slots for windings, single turn coil - active portion and overhang, full-pitch and short-pitch coils, concentrated winding, distributed winding, winding axis, 3D visualization of the above winding types, winding factors. Air-gap MMF distribution with fixed current through - concentrated and distributed and Sinusoidally distributed winding,

MODULE 2: Poly-phase Induction Machines

(10 Lectures)

Construction, Types (squirrel cage and slip-ring). Three windings spatially shifted by 120 degrees (carrying three-phase balanced currents), revolving magnetic field. Operating principle of poly-phase induction motors. Torque Slip Characteristics, Starting and Maximum Torque, Equivalent circuit, Phasor Diagram, Losses and Efficiency, Effect of parameter variation on torque speed characteristics (variation of rotor and stator resistances, stator voltage, frequency), Methods of starting, braking and speed control for induction motors; Generator operation, Self-excitation, Doubly-fed Induction Machines.

MODULE 3: Single-phase Induction Motors

(5 Lectures)

Constructional features of single phase induction motor. Magnetic field produced by a single winding - fixed current and alternating current. Double revolving field theory, equivalent circuit, determination

of parameters, Split-phase starting methods and applications.

MODULE 4: Synchronous Machines

(12 Lectures)

Construction and principles of operation of synchronous generators, emf equation. Armature reaction, leakage reactance, synchronous reactance, and impedance of non-salient pole machines. Short circuit and open circuit tests, short circuit ratio, MMF in salient and non-salient pole machines. Calculation of regulation by synchronous impedance method. MMF method and ASA method.

Introduction to two-reactance theory, locus diagram of synchronous impedance, slip test, damper winding and oscillation of synchronous machines, Synchronization, power angle diagram and synchronizing power. Sub-transient and transient reactance of synchronous machine. Parallel operation and load sharing of synchronous machines.

Construction and principles of operation of synchronous motor. Phasor diagram, effect of varying excitation, effect of load variation, V-curve, O-curve, power angle diagram and stability, Hunting, Two-reaction theory of salient-pole motor, Starting. Use as synchronous phase modifiers.

MODULE 5: Other Motors

(6 Lectures)

1-Phase Commutator Motors: Universal and repulsion motors: Construction and principle of operation, Starting methods, Speed control, Improvement of commutation and power-factor by compensation.

Reluctance Motors (Conventional and Switched): Construction and principle of operation, Speed-torque characteristic.

Stepper Motor: Construction and principle of operation, types, characteristics. Selection and Application.

Brush-less DC motor (BLDC): Construction and principle of operation, types and applications.

5. B. L. Theraja, A. K. Theraja, -A Text Book of Electrical Technology Vol II A.C. and D.C. Machines, S. Chand & Co., 2015.

Course Code	Course Title	Hours per week L-T-P	Credit C
EE181404	Power System-I	3-1-0	4

Prerequisites:

- Basic Electrical Engineering

COURSE OBJECTIVES:

1. To impart knowledge on the basic structure of power system and mechanical/electrical design of overhead lines.
2. To familiarize different types of tower structure and environmental effects on sag calculation.
3. To understand various aspects of underground cables and their increasing uses in power system.
4. To give an idea about the fundamental concepts of electrical power distribution, both AC & DC

COURSE OUTCOMES:

At the end of this course, the students will be able to

CO1: Students will be able to articulate the basics of power system and relate theoretical concepts in engineering problems.

CO2: Students will be able to analyse the performance of transmission lines and its parameters.

CO3: Students will be able to classify different types of insulators and design an environmentally safe supporting structure of transmission line by computing sag and ground clearance given the terrain in which transmission is to be provided.

CO4: Students will be able to apply knowledge with justification in technical issues involved during selection and laying of underground cables.

CO5: Students will be able to classify different types of AC and DC distribution systems.

MODULE 1: General Introduction

(2 Lectures)

Basic structure of power system: Generation, transmission and distributions. Various levels of power transmission and basic layout arrangement of an inter-connected power system network.

MODULE 2: Transmission Line Parameters

(8 Lectures)

Conductor materials, Types of conductors- ACSR, expanded ACSR, Stranded, bundle and composite conductors; Use of standard wire tables. Current distortion Effect-Skin effect and proximity effect.

Inductance of a 1-phase system with composite conductors; Inductance and capacitance of 1-ph & 3-ph single circuit and double circuit transmission lines with symmetrical and unsymmetrical spacing; Transposition; Concept of G.M.D. Effect of earth in 1-ph and 3-ph lines; Charging current.

MODULE 3: Performance of Transmission Lines

(8 Lectures)

Classification of transmission lines- short, medium and long lines: Nominal- T and Nominal- pi representation of medium line. Analysis of long transmission line (Rigorous method). Regulation & efficiency; Generalised Network Constants of a transmission line. Evaluation of ABCD constants from mathematical models (short & medium); SIL, Ferranti effect.

MODULE 4: Mechanical Design

(10 Lectures)

- (a) Line support: Supporting structure for overhead lines, Towers
- (b) Insulators: Types of insulators; Voltage distribution on an insulator string; Stringing efficiency; Methods of grading of insulators and static shielding; Testing of insulators.
- (c) Sag: Calculation of sag & tension – effect of wind and ice loading; Support at different levels; Spacing between conductors.
Introduction: Stringing chart, Sag template, Vibration and Vibration damper, Conductor spacing and ground clearance.
- (d) Corona: Electric stress at surface of overhead line conductors; Disruptive critical voltage; Visual critical voltage; Corona loss; Factors effecting corona loss; Method of reducing loss; Radio interference – electrostatic and electromagnetic interference with communication lines.

MODULE 5: Underground Cable

(7 Lectures)

Different types of underground cables; Insulating materials; Insulation resistance; Breakdown of cable insulation; High voltage cables – Internal & external gas pressure cables, Gas filled cables; Capacitance of single and multi-core cables; Grading of cables; Insulation; Sheath losses; Dielectric losses; Thermal ratings; Testing of cables; Method of cable laying and cable joining; Maximum current carrying capacity of cables.

MODULE 6: Distribution

(5 Lectures)

Classification of distribution system-AC & DC; Design consideration in a distribution system; Scheme of connection- Radial, Ring, Interconnected DC distribution, stepped distributors Concentrated and distributed loads in radial distributors fed at one and both ends. Ring distributor with interconnector.

Text Books:

1. Electrical Power Transmission and Distribution – S. Sivanagaraju, S. Satyanarayana
2. Electrical Power System---C. L. Wadha.
3. Principle of power system—V.K. Mehta, Rohit Mehta
4. A course in Power System- J. B. Gupta
5. Electrical Power Delivery Systems- R. Jayashri...

Reference Books:

1. Power System Engineering- Nagrath and Kothari
2. Switchgear and Protection—S.S. Rao
3. Switchgear and Protection-- M.V. Despande.
4. Electrical Power—S. L. Uppal.
5. Electrical Power System's design—M.V. Despande.

Course Code	Course Title	Hours per week L-T-P	Credit C
EI181405	Signals and Systems	3-0-0	3

COURSE OBJECTIVES

1. To study fundamental concepts of signals, its processing and systems
2. To study mathematical tools for signal analysis

COURSE OUTCOMES (CO)

After successful completion of the course student should be able to:

CO1: Identify various types of signals in continuous-time and discrete-time domain

CO2: Understand Linear Time Invariant (LTI) system and its properties to obtain the response of the system using convolution sum and convolution integral

CO3: Apply knowledge of Fourier Series and Fourier Transform to obtain the frequency domain representation and analysis of signals and systems

CO4: Apply sampling techniques for processing of signals

CO5: Apply knowledge of Z transform and LTI system to design and realize digital filters: FIR and IIR filters

MODULE 1: Introduction to Signals And Systems (6 Lectures)

Definitions, continuous-time (CT) and discrete-time (DT) signals, exponential and sinusoidal signals, signal energy and power, even and odd signals, periodic signals, transformation of independent variables: time-shift, time-reversal and time-scaling, CT and DT systems and their classification, basic properties of CT and DT systems.

MODULE 2: LTI Systems (6 Lectures)

DT LTI systems: convolution sum, CT LTI systems: convolution integral, properties of LTI systems: commutative, distributive and associative properties, LTI systems with and without memory, invertibility, causality and stability of LTI systems, systems described by differential and difference equations, block diagram of LTI systems

MODULE 3: Fourier Series Analysis of Signals (5 Lectures)

Response of LTI systems to complex exponential, representation of periodic signals: The Fourier series, properties of Fourier series, convergence of Fourier series.

MODULE 4: Fourier Transform Analysis of Signals (6 Lectures)

Representation of a-periodic signals: The Fourier Transform, properties of Fourier transform, System analysis by Fourier Transforms, convergence of Fourier transform.

MODULE 5: Sampling (5 Lectures)

Sampling theorem, effect of under-sampling, reconstruction of a signal from its samples, Spectrum of sampled signal.

MODULE 6: Z-Transform**(6 Lectures)**

Definitions, region of convergence, properties of Z-transform, inversion of Z-transforms, system function, applications to system analysis.

MODULE 7: Digital Filters**(6 Lectures)**

Finite Impulse Response (FIR) and Infinite Impulse Response (IIR) systems, FIR and IIR filters, realization of FIR and IIR systems

Text Books:

2. Mitra, S.K.: Digital Signal Processing-a computer based approach, Tata McGraw Hill
3. Xavier, E: Signals, Systems & Signal Processing, S. Chand & Co.
4. Mastering MATLAB, Pearson Education (for Laboratory use)

Course Code	Course Title	Hours per week L-T-P	Credit C
MC181406	Environmental Science	2-0-0	0

MODULE 1: Environment and Ecology

- i. Introduction
- ii. Environment and Ecology
- iii. Objectives of ecological study
- iv. Aspects of Ecology
 - a) Autecology
 - b) Synecology
- v. Ecosystem
 - a) Structural and functional attributes of an ecosystem
 - b) Food chain and food web
 - c) Energy flow
 - d) Biogeochemical cycles

MODULE 2: Land: Use and Abuse

- i. Land use: Impact of land – use on environmental quality
- ii. Land degradation
- iii. Control of land degradation
- iv. Waste land
- v. Wet lands

MODULE 3: Water Pollution

- a) Introduction
- b) Water quality standards
- c) Water pollution
- d) Control of water pollution
- e) Water pollution legislations
- f) Water quality management in Rivers

MODULE 4: Air Pollution

- i. Introduction
 - a) Air pollution system
 - b) Air pollutants
- ii. Air pollution laws
- iii. Control of air pollution
 - a) Source correction method
 - b) Pollution control equipment

MODULE 5: Noise Pollution

- i. Introduction
- ii. Sources of noise pollution
- iii. Effects of noise
 - a) Physical effects
 - b) Physiological effects
 - c) Psychological effects
- iv. controls of Noise pollution

2. Environmental studies by Dr B.S. Chauhan
3. Environmental science and engineering by Henry and Hence
4. Environmental studies for undergraduate course by Dr Susmitha Baskar
5. Chemistry for environmental engineering and science by Clair Sawyer

Course Code	Course Title	Hours per week L-T-P	Credit C
EI181412	Control Systems Lab	0-0-2	1

Course Objectives:

1. To enhance the learning experience of the students in topics encountered in Control Systems using MATLAB software
2. To get hands-on experience in using the control system kits which are developed to learn the fundamental concepts of control systems and control system components

Course Outcomes:

After completion of the course the students will be able to

1. Use MATLAB software to learn control systems (CO1)
2. Analyze the response of control system by measuring relevant parameters (CO2)
3. Interpret the role of various components in control system (CO3)
4. Compare theoretical predictions with experimental results and attempt to resolve any apparent differences (CO4)

Laboratory Course: PART I:

Problems related to theory course on 'Control System' (EI181412) and to be solved using MATLAB software are to be given as assignments.

Laboratory Course: PART II:

LIST OF EXPERIMENTS

1. Light Intensity Control Systems
2. DC Position Control Systems
3. Potentiometer Error Detector
4. Speed-Torque Characteristics of DC Servomotor
5. Synchro-Transmitter Control Transformer pair as an Error Detector

Course Code	Course Title	Hours per week L-T-P	Credit C
EE181413	Electrical Machines-II Lab	0-0-3	1.5

Course Objectives:

The Electrical Machines-I Laboratory is designed to provide the students with the practical knowledge of electrical machines specifically keeping in view the following objectives:

1. to get hands-on experience in performing the basic tests on electrical machines
2. to reinforce the theoretical concepts with related practical understanding
3. to know about the various precautionary measures necessary in handling electrical machines

Course Outcome:

After completing this course, the students will

CO1:

be familiar with the mode of starting, switching-off, and taking precautionary measures while handling electrical machines

CO2:

be able to reinforce their theoretical concepts by way of experimentation

CO2:

develop report writing skill

LIST OF EXPERIMENTS

1. Retardation test on a D.C. Machine
2. No-load test and blocked-rotor test on 3-phase induction motor
3. Working of Single phase and three-phase Induction Regulator
4. V-Curves of a synchronous motor
5. Slip-Test on Alternator
6. Regulation of alternator by synchronous impedance and MMF method
7. Measurement of real and reactive power of induction generator
8. Synchronization of alternators

Course Code	Course Title	Hours per week L-T-P	Credit C
EI181411	Electrical Measurements Lab	0-0-2	1

Course Objectives:

The Electrical Measurement Lab gives idea about how to visualize and work in laboratory environment and how to work in a team. Students understand the applications of various A.C and D.C Bridge in practical Electrical and Instrumentation Engineering field. Students learn about how to measure resistance, Inductance, Capacitance, Voltage, Current, Power, Power Factor and Electrical Energy using different experiments in the Lab.

Course Outcomes (CO)

After completing this course

1. Student will be able to measure the resistance, inductance and capacitance using DC and AC bridges.
2. Student will be able to calibrate and test single phase energy meter and to measure 3-phase active power with balanced 3-phase R-L load.
3. Student will be able to calibrate and test single phase current and potential transformers and measures the core loss in magnetic circuit.

LIST OF EXPERIMENTS

1. To Measure the Low Resistance of a Wire or Rod Using Student Kelvin Double Bridge
2. To Measure the inductance of a given coil by Anderson Bridge method
3. To Measure Unknown Inductance and Capacitance by Maxwell's L/C Bridge
4. To Measure unknown value of Capacitance using Wien Bridge
5. To Measure the Value of unknown Capacitance by Schering Bridge
6. Calibration of single phase energy meter with resistive load To Measure 3-phase Power by Two Wattmeter Method
7. To Measure 3-phase Power by Two Wattmeter Method
8. Study of CT and PT
9. Lissajous Pattern using CRO
10. Temperature measurement using RTD
11. Temperature measurement using Thermistor
12. Temperature measurement using Thermocouple

Detailed Syllabus:

Course Code	Course Title	Hours per week L-T-P	Credit C
EI181501	Power System-II	3-1-0	4

Course Objectives:

This course is developed for the purpose of providing detailed knowledge about power system operational planning using computational methods. In a power system, it is not allowed to carry out experiments related to operational planning of the system. Therefore, simulation based analytical methods are used for planning and operation of a power system related to Fault analysis, load flow analysis, topology detection, Steady state, dynamic and Transient stability analysis etc. Fundamentals of power system network analysis using bus matrix concept has been incorporated in the course. The categories of fault analysis, such as symmetrical and unsymmetrical fault analysis methods involving symmetrical component concept has been highlighted in the course. Load flow analysis is dealt using GS, and NR methods. Power system slow and fast dynamic analysis such as transient stability analysis, using equal area criterion and numerical solution of power swing equation under transient contingency condition are introduced in the course. This course also introduces the concept of neutral grounding and overvoltage phenomenon in power systems.

COURSE OUTCOMES:

After the successful completion of the course student should be able:

CO1: To define the basic idea of power system network representation for analysis of an interconnected power system.

CO2: To apply the concept of power system fault analysis in power system planning and operation.

CO3: To define load flow analysis and to apply it in power system operation and planning

CO4: To define the basic concept of power system stability and its application in the understating the stability condition under transient and dynamic condition of a power system.

CO5: To understand the concept of neutral grounding and overvoltage phenomenon in power system operation.

MODULE 1: Power System Economics

(4 Lectures)

Economics of power plants, load curves, load factors, diversity factors; Utilization factor, Tariffs and Tariff structure, Economics of power factor improvement, Definitions and Characteristics of Base load and Peak load plant.

MODULE 2: Symmetrical Components and Unsymmetrical Fault Calculations

(6 Lectures)

Fortesque's theorem. Symmetrical components of an unbalanced 3-phase system: average power in terms of symmetrical components, sequence impedances, fault calculations, graphical method for determining sequence components, network equations. LG, LL, LLG faults. Effect of fault impedance on fault current. Sequence networks.

MODULE 3: Neutral Grounding

(4 Lectures)

Effectively grounded system. Ungrounded system. Arcing ground. Methods of neutral grounding. Resistance, Reactance and Resonant grounding (Peterson coil) Earthing Transformers. Equipment grounding. Generator neutral Breaker

MODULE 4: Representation of Power System Components and Network Matrix (6 Lectures)
Per Unit Representation of power system elements such as: Synchronous machine, transformers with tap setting, transmission line etc. Single line diagram. Problem Solving.

Network matrix: Primitive network, bus incidence matrix, formation of Y-bus by singular transformation , networks with mutually coupled elements, formation of Z-bus by matrix inversion , formation of Z-bus using the building algorithm – addition of a tree branch p to reference bus , addition of a link between buses p and q , addition of a link between bus p and reference bus.

MODULE 5: Load Flow Analysis (10 Lectures)
Introduction, classification of buses, representation of transformers, Gauss Seidel iterative method using Y-bus, N-R iterative method using Y-bus. Calculation of line flows.

MODULE 6: Power System Stability (10 Lectures)
Introduction. Dynamics of synchronous machine, Swing equation. Power-angle curve. Steady- state and transient stabilities. Equal area criterion. Calculation of power-angle curves for fault and post fault conditions for various types of fault, effect of reclosing. Numerical solution of swing equation. Dynamic Stability. Factors affecting stability.

Textbooks/Reference Books:

1. Electrical Power—S.L.Uppal.
2. Electrical Power System---C.L.Wadha.
3. Computer Methods in Power System Analysis – Stagg, El-abiad McGraw-Hill
4. Power system operation and Control – P S Murty Tata McGRAW-Hill
5. Computer Techniques in Power System Analysis: M A Pai, Tata McGRAW HILL
6. Power System Analysis: I J Nagrath and D P Kothari, Tata McGRAW HILL

Course Code	Course Title	Hours per week L-T-P	Credit C
EI181502	Power Electronics	3-0-0	3

Prerequisites:

Knowledge of basic electrical and electronics engineering

COURSE OBJECTIVES:

To understand the principle of operation of SCR, GTO devices etc.

To know about triggering, commutation of SCR, firing circuits, commutation circuits etc.

To understand various connections of thyristors, protection etc.

To understand operation of various converters. UPS etc.

To know principle of operation of chopper, inverter, their voltage control etc.

COURSE OUTCOMES:

At the end of the course, the students will be able to

CO1: Use various switching devices such as SCR, GTO, etc for power electronic applications.

CO2: Justify use of various regulators, UPS circuits, their working, SMPS etc.

CO3: Derive in-depth knowledge about single phase and three phase converters, AC regulators, cyclo-converters, dual-converters etc.

CO4: Examine working of various inverters and choppers, their output voltage control methods, specific inverters and choppers and their applications.

CO5: Assess use of Battery Chargers, replacement of electro-mechanical devices by SCRs.

MODULE 1: Semiconductor Power Devices

(10 Lectures)

Introduction, power diodes, power transistors (BJT, MOFET, IGBT, ICT etc) and SCRs and their operations, GTOs, Triacs and other types of thyristors, their characteristics, ratings, mounting and cooling. Series and parallel connections of SCRs. Triggering and control.

MODULE 2: Regulated Power Supplies

(5 Lectures)

Requirements and principles Constant voltage and current regulators, use of ICs, Line regulation, introduction to switching regulators. Switching mode power supply, UPS – ON-line and OFF-LINE types,

MODULE 3: Converter Operation with SCRs

(10 Lectures)

Single phase half- wave, full- wave and bridge circuits, three- phase half wave and bridge circuits, six- phase with interphase transformer, fully controlled and half- controlled circuits. Effects of load and source inductance. AC controller – single phase and three phase, half control and full control, applications of ac controllers. Dual converter and cycloconverter operating modes. Line commuted inverters, firing and control circuits for different operations.

MODULE 4: Forward Commutation and Forced Commutated Inverters

(8 Lectures)

Forced commutation circuits, parallel, series and bridge (single- phase and three- phase) inverters, McMurray and McMurray- Bedford inverter circuits, Voltage and current source inverters. Output voltage control harmonics eliminations. Firing circuits for inverters.

MODULE 5: Choppers**(8 Lectures)**

Principles of operation, classification, Time Ratio control & Current Limit Control, DC, AC, and multi-quadrant choppers, Heumann's (voltage commutated), Morgan's, Jone's, and Mazda's choppers. Applications.

MODULE 6: Application of SCRs**(4 Lectures)**

SCR battery chargers, replacement of electromechanical devices by SCRs

Textbooks:

6. Ramamurthy, m.: An Introduction to Thrusters and their Applications- East West Press.

Course Code	Course Title	Hours per week L-T-P	Credit C
EI181503	Microprocessors	3-0-0	3

Prerequisites:

- Analogue Electronics, Digital Electronics.

COURSE OUTCOMES:

After the successful completion of the course student should be able to:

CO1: To define the basic concept of programmable device and structural arrangement of 8085 and its instructions.

CO2: Develop the general idea for interfacing memory devices and I/O devices to ensure unique address for each device.

CO3: To develop the basic concepts of PPIs and their operational concepts, and apply this knowledge in different engineering applications.

CO4: Develop assembly and machine language microprocessor programs for utilization in societal, academic and industrial purposes.

CO5: To demonstrate the basic evolutionary process leading to the development of microprocessor-based system for a few practical applications.

MODULE 1: Microprocessor Architecture

(6 Lectures)

Introduction to the microprocessor- Introduction to tri-state device- register, ALU, counter etc. Basic concepts of programmable device – Bus organization, system components etc. Block diagram of μ P 0885- data bus, address bus, timing and control section, registers, etc

MODULE 2: Interfacing Memory Devices and I/O devices

(4 Lectures)

System BUS representation, Address space and its portioning; address decoding, memory and I/O mapping and management.

MODULE 3: Programming Microprocessors

(12 Lectures)

Data representation, instruction formats, addressing modes, Instruction set, software design, assembly language programming, program looping, subroutine linkage - uses of stack and stack pointer, push pop operation etc. Assembly and code language programming with examples, timing diagram of instructions

MODULE 4: Support PPIs

(12 Lectures)

PPIs - 8255, 8253 and 8279; their functional block diagram, operational modes and configuration of the device in different mode of operations, assembly language program for using the PPIs in application purposes. Such as, data transfer, counter operation and display data in seven segment LED display units and data to read data through key board respectively.

MODULE 5: Application of μ P based system

(6 Lectures)

Microprocessor based instrumentation system for measurement of physical parameters, such as-temperature, light intensity, smoke, moisture content etc. Operation electro-magnetic and static relay for switching operation. A traffic light control, speed controller of de motor etc.

Textbooks/Reference Books:

- Microprocessor architecture, programming and applications—Ramesh S Gaonakar –Penram International (T1)
- Fundamentals of Microprocessors and Microcontrollers—B Ram—Dhanpat Rai Publications (T2)
- The 8085 Microprocessor and Programming and Interfacing—K Udantkus—Pearson Education (T3)

Course Code	Course Title	Hours per week L-T-P	Credit
EI1815PE11	Advanced Control System	3-0-0	3

Prerequisites:

Control System

COURSE OBJECTIVES: To provide

- The knowledge of state variable and its application to control system,
- Nonlinear control system,
- Discrete control system
- Optimal control system.

COURSE OUTCOMES: After the successful completion of the course student should be able to:

CO1: Apply the knowledge of state variable to control system.

CO2: Analyze the nonlinear control system

CO3: Evaluate stability of a given linear and non-linear control system Analyze the discrete control system

CO4: To design an optimal control to meet specific criteria

CO5: Analyze and evaluate the stability of a given discrete control system.

MODULE 1: State Space Analysis

(10 Lectures)

State Space Representation, Solution of State Equation, State Transition Matrix, Canonical Forms – Controllable Canonical Form, Observable Canonical Form, Jordan Canonical Form. Controllability and Observability: Tests for controllability and observability for continuous time systems – Time varying case, minimum energy control, time invariant case, Principle of Duality, Controllability and observability form Jordan canonical form and other canonical forms.

MODULE 2: Nonlinear Control system

(8 Lectures)

Introduction to nonlinear systems, Types of nonlinearities, describing functions, describing function analysis of nonlinear control systems. Phase-Plane Analysis: Introduction to phase-plane analysis, Method of Isoclines for Constructing Trajectories, singular points, phase-plane analysis of nonlinear control systems.

MODULE 3: Stability Analysis

(6 Lectures)

Stability in the sense of Lyapunov., Lyapunov's stability and Lyapunov's instability theorems. Direct method of Lyapunov for the Linear and Nonlinear continuous time autonomous systems. Modal Control: Effect of state feedback on controllability and observability, Design of State Feedback Control through Pole placement. Full order observer and reduced order observer

MODULE 4: Optimal Control

(3 Lectures)

Formulation of optimal control problem. State regulator problem. Output regulator problem. Tracking problem, Continuous-Time Linear Regulators.

MODULE 5: Discrete Time Systems

(5 Lectures)

Introduction to discrete – time systems; Z- transform, inverse Z- transformation; solving difference equation by the Z-transform method; pulse- transfer function; stability analysis in the Z- plane.

Textbooks:

1. K. Ogata, Modern Control Engineering, PHI.
2. I.J. Nagarath, M.Gopal, Control Systems Engineering, NAI.
3. D. Roy Choudhury., Modern Control Engineering, PHI
4. B.N.Sarkar., Advanced Control System, PHI

Reference Books:

1. M. Gopal, Modern Control System Theory, New Age International.
2. Stainslaw H. Zak, Systems and Control, Oxford Press.
3. B.C. Kuo., Automatic Control System, PHI

Course Code	Course Title	Hours per week L-T-P	Credit
EI1815PE12	Advanced Electrical Measurements	3-0-0	3

COURSE OBJECTIVES:

- To study fundamental measuring concept in various measuring instruments and their practical applications in Electrical Engineering and Instrumentation Engineering fields.

COURSE OUTCOMES: At the end of this course, the students will be able to

CO1: analyze construction, working principle and applications of electronic and digital measuring instruments and methods.

CO2: develop systems for measurement of non-electrical physical quantities

CO3: analyze performance of measurement of electrical and non-electrical quantities

MODULE 1: Characteristic of Instruments and Measuring Systems (2 Lectures)

Static characteristic – accuracy, sensitivity, reproducibility, drift, static error and dead zone. Dynamic characteristic- response to step and sinusoidal signals. Errors occurring in measurement

MODULE 2: Electronic and Digital meters (9 Lectures)

(a) Electronic Voltmeters: Advantage & disadvantages of using electronic voltmeters; Different stages in AC & DC electronic voltmeters; Balanced bridge voltmeter; Principle and circuit diagrams for average responding, peak responding & RMS responding voltmeters. (b) Digital voltmeters: Classification of digital voltmeters; Principle, block diagram and signal wave form of ramp type, stair case ramp type and integrating type digital voltmeters. (c) Electronic Multimeter & Q-meter.

MODULE 3: Digital Storage Oscilloscopes (10 Lectures)

Block diagram representation of DSO circuit; Principles of operation of Digital Storage Oscilloscopes (DSO); Measurement of voltage, current, frequency using DSO.

MODULE 4: Transducers (7 Lectures)

Classification and Selection of Transducers - Primary and Secondary Transducers; Construction, Principle of Operation and Applications of Diaphragms, Bellows, Bourden Tubes, Springs, Capacitive, Piezoelectric and Photoelectric Transducers; Strain Gauges; Hall sensors; Linear Variable Differential Transformer (LVDT); Measurement of non-electrical physical quantities: temperature, pressure, torque, flow, Speed and Position

MODULE 5: Recorders (5 Lectures)

Different types of recorders; Construction, working principle and circuit diagrams of Strip-chart & X-Y recorders

Text Books:

1. Electrical Measurements and Measuring Instruments 2nd Ed 2013 – R. K. Rajput, S. Chand & Co
2. A Course in Electrical and Electronic Measurements and Instrumentation 19th Ed 2011 - A. K. Sawhney and Puneet Sawhney, Dhanpat Rai & Sons

Reference Books:

2. Electrical Measurement and Measuring Instruments by U.A Bakshi, A.V. Bakshi
3. Golding and Widdis – Electrical Measurements and measuring instruments. AH WHEELER & Company
4. A Course in Electrical and Electronic Measurements and Instrumentation 14th Ed 2014 – J. B. Gupta, S. K. Kataria & Sons.
5. Electronic Instrumentation and Measurements 3rd Ed 2013 – Davis A. Bell, Oxford University Press
6. Electrical Measurement and Measuring Instruments 2011 - E.W. Golding and F.C Widdis, Reem Publications Pvt. Ltd.

Course Code	Course Title	Hours per week L-T-P	Credit
EI1815PE13	Computer Organization	3-0-0	3

COURSE OBJECTIVES:

- To study fundamental concepts and design circuits of Computer Organization

COURSE OUTCOMES: At the end of this course, the students will be able to

CO1: analyze construction of digital general-purpose computer.

CO2: analyze the working principle of basic building blocks (processor, memory, input/output devices) of digital general-purpose computer and their sequential/parallel operation.

CO3: design digital general-purpose computer

MODULE 1: Computer Evolution and Arithmetic (8 Lectures)

A Brief History of computers, Designing for Performance, Von Neumann Architecture, Hardware architecture, Computer Components, Interconnection Structures, Bus Interconnection, Scalar Data Types, Fixed and Floating-point numbers, Signed and unsigned numbers, Integer Arithmetic, 2's Complement methods for multiplication and division, Booths Algorithm, IEEE standards, Hardware Implementation.

MODULE 2: The Central Processing Unit (8 Lectures)

Machine Instruction characteristics, types of operands, types of operations, Addressing modes, Instruction formats, Instruction types, Processor organization, Intel 8086 as example, Programmers model of 8086, max/min mode, Register Organization, Instruction cycles, Read Write cycles.

MODULE 3: The Control Unit (6 Lectures)

Single Bus Organization, Control Unit Operations: Instruction sequencing, Micro operations and Register Transfer. Hardwired Control: Design methods – State table and classical method, Design Examples - Multiplier CU. Micro-programmed Control: Basic concepts, Microinstructions and microprogram sequencing.

MODULE 4: Memory Organization (6 Lectures)

Characteristics of memory systems, Internal and External Memory, Types of memories: EEPROM, DDR4 SDRAM, High-Speed Memories: Cache Memory, Organization and Mapping Techniques, Replacement Algorithms, Cache Coherence, MESI protocol. Virtual Memory: Main Memory allocation, Segmentation, Paging, Address Translation Virtual to Physical.

MODULE 5: I/O Organization (6 Lectures)

Input/Output Systems, Programmed I/O, Interrupt Driven I/O, 8086 Interrupt structure, Direct Memory Access (DMA), Buses and standard Interfaces: Synchronous, Asynchronous, PCI, SCSI, USB Ports, Secondary Storage: Magnetic Disk drives, Optical memory drives, Flash drives, USB Pen drives, Solid state drives.

MODULE 6: Parallel Organization (6 Lectures)

Instruction level pipelining and Superscalar Processors, Multiple Processor Organizations, Closely and Loosely coupled multiprocessors systems, Symmetric Multiprocessors, Clusters, Vector Computations, RISC: Instruction execution characteristics, RISC architecture and pipelining

Text Books:

Course Code	Course Title	Hours per week L-T-P	Credit C
EI1815PE14	Electrical System Design and Drawing	3-0-0	3

COURSE OBJECTIVES:

- To study fundamental concepts of Electrical System Design & Drawing

COURSE OUTCOMES: At the end of this course, the students will be able to

CO1: draw different parts of electrical machines and domestic electrical wiring circuit diagram

CO2: design electrical machines and domestic electrical wiring circuit

CO3: determine costs and capacities of electrical machines and domestic electrical wiring systems

MODULE 1: Fundamentals of Electrical Machine Design (3 Lectures)

Standard specification of frame size, conductors and insulation; Magnetization and loss curve; Choice of specific loading; Heating and cooling of electrical machines.

MODULE 2: Design of D.C. Machines (10 Lectures)

Construction details; Output equation; Main dimension; Choice of specific loadings; Choice of number of poles; Armature design; Design of field poles and field coils; Design of commutator and brushes.

MODULE 3: Design of Transformers (10 Lectures)

Construction details of core and shell type transformers; Output rating of single phase and three phase transformers; Optimum design of transformers; Design of yoke, core and winding for core and shell type transformers; Equivalent circuit parameter from designed data; Design of tank and cooling tubes of transformers.

MODULE 4: Design of A.C. Machines (10 Lectures)

Construction details of A.C. machines; Output equation; Main dimensions; Choice of specific loadings; Design of stator; Design of squirrel cage and slip ring rotor; Equivalent circuit parameter from designed data; Short circuit ratio; Design of rotor of cylindrical pole and salient pole machines.

MODULE 5: Domestic Wiring (5 Lectures)

Types of cables (names only); Types of wiring; Circuit layouts: single-phase A.C mains to DB; 3-phase connections; Accessories – Main switch, Ceiling rose, Fuse, MCB, DB; Megger; Testing of wiring installation; Earthing; Lamps: Fluorescent tube and its connection and operation; Indian Electricity Rules regarding electrical installation.

Suggested Practical:

Computer Aided Design: Assembly of elemental coefficient matrix, Global coefficient matrix, Application of FEM technique for design problems. Use of open source FEM software for 2D design, Computation of Capacitance of capacitor, cable, multi dielectric cable through FEM, Computation of electrostatic field for various geometry, skin and proximity effect in conductors. 2D FEM open source software based electrical apparatus design; 2D FEM open source software-based DC machine and Transformer part design.

Textbooks:

4. Design of Rotating Machines – Juha Pyrhonen, Tapani Jokinen and Valeria Hrabovcova, Wiley – Blackwell
5. Electrical Machine Design Data Book - A. Shanmugasundaram, New Age International
6. Design of Electrical Machines – V. N. Mittle and Arvind Mittal, Standard Publishers Distributors
7. Electrical Machine Design – Seraj Ahamad, Vayu Education of India
8. Electrical Engineering Drawing – K.L. Narang (Satya prakash: New Delhi)
9. Computer Aided Design of Electrical Machines - V.K. Maurya, Ritu Raj Jallan and Shasya Shukla, S. K. Kataria & Sons
10. Guidelines for Electrical Works in Residential Building – Suruhanjaya Tenaga, www.st.gov.my
11. Elect. Drawing and Design – Surjit Singh
12. General electrical drawing – Arora and Chand (New Height, Delhi)
13. Sub-station Design & Equipments- Gupta & Satnam
14. Performance & Design of A.C Machines –M. G Say

Course Code	Course Title	Hours per week L-T-P	Credit C
EI1815PE15	Electronic System Design	3-0-0	3

COURSE OBJECTIVES:

- To study the techniques for designing Analog and Digital Electronic circuits using discrete devices and ICs.
- To learn fundamentals of software for simulating and testing analog and digital systems design.

COURSE OUTCOMES: At the end of this course, the students will be able to

CO1: draw the electronic devices and integrated circuits in details

CO2: design electronic systems

CO3: compute performance and costs of electronic systems

PART -1 Analog Electronic Systems

MODULE 1: Design of DC Power Supplies

Design of Regulated DC Power Supply Units – Design of FW Rectifiers, Capacitor and Inductor Filters, Combination Filters, Voltage Regulators, Use of IC Voltage Regulators. Introduction to SMPS.

MODULE 2: Design of Transistor Amplifiers and Switches

Interpretation of Data-Sheets of devices, Concept of Load Line, Negative Feedback Systems, Design of Cascaded Small Signal Amplifiers using BJT, JFET and MOSFET, Design of Power Amplifiers using BJT, MOSFET, and OPAMPS. Concept of Positive Feedback, Design of Oscillators and Signal Generators, Design of Switches using BJT, JFET, MOSFET.

MODULE 3: Design of Opamp Applications

Design of other OPAMP applications, Analog Computational Applications and Analog Electronic Simulations, Active Filters, Non-Linear applications, ADC and DAC. Design of applications using 555 Timers and PLL.

PART – II Digital Electronic Systems

MODULE 1: Design of Digital Systems

Review of Digital Logic Simplification techniques, VEM technique and Program-Table technique. Logic Implementation using- Universal Gates, Multiplexers, ROM, PLA and FPGA

MODULE 2: Design of State Machine

State Flow Diagram, State Transition Matrix, State Tables, and Excitation Table of Flip-Flops. Design of Digital Systems as State Machines. RTL Level Design of Digital Systems

MODULE 3: Introduction to Logic Specification Language

VHDL and VERILOG. Design of Digital Systems using VHDL. Design of Finite State Machine with VHDL

Suggested Practical:

MINI – PROJECT

1. One Hardware Project with Presentation of Software Simulation of (a) Transistorized Circuit, (b) OPAMP IC, (c) Timer IC, (d) PLL IC.
2. VHDL or VERILOG Simulation and Presentation of a State Machine and an RTL level design.

Text Books:

1. Linear integrated Circuits: Roy Choudhury & Jain: New Age International Publications.
2. Digital Electronics: Sanjay Sharma, Katsons

Reference Books:

3. Digital Logic and Computer Design: Moris Mano: Pearson India.
4. Fundamentals of Digital and Computer Design with VHDL: Richard S Sandige & Michael L Sandige: McGraw Hill India.
5. Electronic Devices and Circuits: David Bell: Oxford University Press.
6. Integrated Electronics –Millman & Halkias

Course Code	Course Title	Hours per week L-T-P	Credit C
EI1815OE11	Data Structures and Algorithms Basics	3-0-0	3

Prerequisites:

- Basic mathematics
- Basic understanding of text editor
- C programming language
- Compilation and execution of programs

COURSE OBJECTIVES:

The main objective of this course is to introduce the students to the basic concepts of data structures which are the programmatic way of storing data so that data can be used efficiently. Nowadays in every field various types of data are used in one way or the other. By applying data structures and algorithms (DSA), data can be organized in such a way that all items may not be required to be searched or sorted and the analysis can be performed almost instantly.

COURSE OUTCOMES: After completion of the course students will be able to

CO1: apply fundamental data structures for technical problem solving

CO2: apply the knowledge of DSA to organize the data in a systematic way to use it efficiently

CO3: demonstrate reduction in memory usage and running time of application programs

CO4: design algorithm for practical engineering and technical problem solving.

MODULE 1: Introduction to Data Structures and Algorithms

(6 Lectures)

Need of DSA, Application of DSA, Characteristics of Data Structures. Basic terminology of Data Structures, Categories of algorithm, Characteristics of algorithms, Algorithm complexity, space complexity, time complexity.

MODULE 2: Data Structures

(12 Lectures)

Basics of DSA, Array data structure, pointers, queue, stack, Linked lists, Doubly linked lists, circular linked lists.

MODULE 3: Searching Algorithms

(6 Lectures)

Basics idea of searching algorithms and programs for-- Linear search, Binary search, hashing scheme

MODULE 4: Sorting Algorithms

(7 Lectures)

Basic idea of sorting algorithms and programs for—

Bubble sort, Insertion sort, Selection sort, Merge sort, Quick sort and Radix sort.

MODULE 5: Graph Data Structure

(5 Lectures)

Basic idea of graph, terminology of graph data structure. Algorithms and programs for representation of directed and undirected graphs as data structures.

MODULE 6: Tree Data structure

(4 Lectures)

Basic idea of tree, terminology. Binary search tree representation and basic operations.

Text books:

1. M.A.Weiss-Data Structures & Algorithms Analysis in C++ , (Addition Wesley).
2. L. Tannenbaum- Data Structures Using C, (PHI).

Reference books:

1. Lipshutz- Theory and problems of Data Structure, (McGraw Hill).
2. A. N. Kamthane -Introduction to data structures in C (Pearson)

Course Code	Course Title	Hours per week L-T-P	Credit C
EI1815OE12	Computer Oriented Numerical Methods	3-0-0	3

Prerequisites:

COURSE OBJECTIVES:

The course is designed with the objective of inculcating ability and skill in software development applied to engineering applications. The numerical techniques are extensively used in engineering problem solving environment. Therefore, the course is developed in such a way that the numerical techniques are directly implemented using software platform (C-program technique). The course contains numerical techniques for solution of linear and nonlinear equation for single and multivariable systems. Linear and non-linear interpolation techniques are incorporated in the course. Finally, the numerical differentiation and integration and numerical solutions of differential equation techniques are taught in the course.

COURSE OUTCOMES: At the end of this course, the students will be able to

CO1. Define the basic concept of numbers representation and propagation of error in numerical computation.

CO2. Apply the iterative procedures for the solution of linear and non-linear set of equations involving matrix solution technique.

CO3. Demonstrate the basic role of interpolation, and to apply it to numerical differentiation.

CO4. To apply the concept of numerical integration for engineering applications

CO5. To apply the concept of numerical methods for the solution of ODE applied to engineering applications

MODULE 1: Computer Arithmetic

(4 Lectures)

Introduction, Floating point representation of numbers and floating-point arithmetic, computational errors, Relative and absolute errors, Error propagation, Iterative processes- convergence and acceleration.

MODULE 2: Iterative methods

(5 Lectures)

Transcendental equations, Methods of bisection, Method of false position, Newton Raphson method, Complex roots, Synthetic division.

MODULE 3: Matrices and Linear Systems of Equations

(10 Lectures)

Matrix inversion, LU decomposition, Solution of linear system of equations by direct methods—Gauss elimination method, ill—conditioned system, Pivotal condensation, Gauss-Siedel iteration method, Gauss-Jordan matrix inversion, Eigen values and Eigen vectors, N—R method for non-linear system of equations.

MODULE 4: Finite Difference and Interpolation

(10 Lectures)

Forward difference, Backward difference and central difference, Symbolic relations, Interpolation with equal intervals, Interpolation using forward difference, Newton's and Gauss's formula for interpolation, Interpolation with unequal intervals, Newton's formula, Lagrange's polynomial interpolation.

MODULE 5: Numerical Differentiation and Integration

(5 Lectures)

Differentiation by polynomial fit, errors in numerical differentiation, numerical integration—Trapezoidal rule, Simpson's rule, Romberg method.

MODULE 6: Ordinary Differential Equations

(6 Lectures)

Taylor's series method, Euler's method, Modified Euler's method, Runga-Kutta method, Predictor-Corrector method.

N: B: As there will be no practical classes for this subject student will be given 2 mini projects to utilize the concept that will involve programming.

2. Srimanath Pal: Numerical Methods -Principles, Analysis, and Algorithms, Oxford
3. S Rajasekaran,: Numerical Methods in Science and Engineering - A Practical Approach, S.Chand
4. T Veerarajan, T Ramachandran: Numerical Methods with programming in C, TMH
5. S.S. Sastry: Introductory Methods of Numerical Analysis, PHI

Course Code	Course Title	Hours per week L-T-P	Credit C
EI1815OE13	Digital Signal Processing	3-0-0	3

Prerequisites: Signals and Systems

COURSE OBJECTIVES:

- To teach the basic concepts of Discrete Signals and Digital Signals
- To teach Digital Signal Processing Algorithms.

COURSE OUTCOMES: At the end of this course, the students will be able to

CO1: Represent signals mathematically in continuous and discrete-time, and in the frequency domain

CO2: Analyze discrete-time systems using z-transform.

CO3: Understand the Discrete-Fourier Transform (DFT) and the FFT algorithms.

CO4: Design digital filters for various applications.

CO5: Apply digital signal processing for the analysis of real-life signals.

MODULE 1: Discrete-Time Signals and Systems (6 Lectures)

Discrete time signals and systems: Sequences; representation of signals on orthogonal basis; Representation of discrete systems using difference equations, Sampling and reconstruction of signals - aliasing; Sampling theorem and Nyquist rate.

MODULE 2: Z-transform (6 Lectures)

z-Transform, Region of Convergence, Analysis of Linear Shift Invariant systems using z- transform, Properties of z-transform for causal signals, Interpretation of stability in z-domain, Inverse z-transforms.

MODULE 3: Discrete Fourier Transform (10 Lectures)

Frequency Domain Analysis, Discrete Fourier Transform (DFT), Properties of DFT, Convolution of signals, Fast Fourier Transform Algorithm, Parseval's Identity, Implementation of Discrete Time Systems.

MODULE 4: Design of Digital filters (12 Lectures)

Design of FIR Digital filters: Window method, Park-McClellan's method. Design of IIR Digital Filters: Butterworth, Chebyshev and Elliptic Approximations; Low-pass, Band-pass, Band-stop and High-pass filters. Effect of finite register length in FIR filter design. Parametric and non-parametric spectral estimation. Introduction to multi-rate signal processing.

MODULE 5: Applications of Digital Signal Processing (6 Lectures)

Correlation Functions and Power Spectra, Stationary Processes, Optimal filtering using ARMA Model, Linear Mean-Square Estimation, Wiener Filter.

Textbooks/Reference Books:

Course Code	Course Title	Hours per week L-T-P	Credit C
HS181506	Engineering Economics	3-0-0	3

Course Outcomes (COs):

The students will be able to

1. Acquire knowledge about economics its nature, scope and importance.
2. Understand the economic laws, principles, and theories and their relevance in present day situation.
3. Develop the ability of critical thinking to meet the challenges at the national and global problems.
4. Apply knowledge in finding out socio-economic problems and appropriate measures to deal with them.
5. Equip students with vital knowledge to run government and non-government institutions and bodies.
6. Assemble knowledge which is vital for industry and research and evolve proper policy for economic development.

MODULE 1: Introduction To Economics

(3 Lectures)

Meaning and Definition of Economics, Nature and Scope of Economics, Concept of Micro and Macro Economics.

MODULE 2: Utility Analysis

(3 Lecture)

Meaning of Utility, Utility Function, Consumers Equilibrium, Concept of Indifference Curve, properties of Indifference Curve, Equilibrium under Indifference Curve.

MODULE 3 : Demand and Supply Analysis

(4 Lectures)

Law of Demand, Demand Function, Elasticity of Demand, Types of Elasticity of Demand, Measurement of Elasticity of Demand, Demand Forecasting, Law of Supply, Supply Function.

MODULE 4: Revenue, Production & Cost Analysis

(4 Lectures)

Average, Marginal and Total Revenue, Revenue Function, Average, Marginal and Total Cost, Cost Function, Short and Long Run Cost Curves. Break Even Point, Managerial Uses of Cost Function, Cobb Douglas Production Function.

MODULE 5: Market Structure

(4 Lectures)

Concept of Market, Price-Output Determination under Perfect Competition, Monopoly Market and Monopolistic Competition.

MODULE 6 : Money, Banking and National Income

(8 Lectures)

Definition of Money, Function of Money, Index Numbers, Construction of Index Numbers, value of Money, Causes of Inflation, Functions of Commercial and central bank, Central bank and its monetary policy, Money Market and Capital Market, Functions of Stock exchange, Concept of National Income, Measurement of National Income, Concept of Investment.

MODULE 7: Introduction to Environmental Economics**(5 Lectures)**

Concept of Environmental Economics, Cost -Benefit Analysis, Social Cost, Externalities, Concept of Pareto Equilibrium, Externality, Market Failure.

MODULE 8: Public Finance**(3 Lectures)**

Introduction to Public Finance, Concept of Budget, Types of Budget, Budget Receipts, Concept of Goods and services Tax (GST)

Textbooks/Reference Books:

1. Managerial Economics by V. Agarwal: Pearson Pvt. Limited, New Delhi.
2. Engineering Economics by Dr. A. Ahmed & G. Begum: Chandra prakash, Guwahati
3. Principles of Engineering Economics with Application by Dr. Z. A. Khan, A. N. Siddiquee, B. Kumar, M. H. Abidi: Cambridge University Press.
4. Public Finance and Public Policy by Dr. R. K Choudhury: Kalayani publishers
5. Quantitative Methods for Economics by R. Veerachamy: New Age International Publication Ltd.
6. Micro and Macro Economics by Dr. M. L. Seth: Educational Publishers , Agra -3
7. A Koutsoyiannis: Modern Microeconomics
8. Environmental Economics by R. N. Bhattacharya: Oxford Publication.

Course Code	Course Title	Hours per week L-T-P	Credit C
EI181512	Power Electronics Lab	0-0-2	1

COURSE OBJECTIVES:

To experience operation of SCR, GTO devices, principle of operation of converter, chopper, inverter and regulated power supply circuits.

COURSE OUTCOMES:

At the end of the course, the students will be able to

CO1: Build and operate Power Electronic circuits

CO2: Analyze results of operation of converter and inverter circuits

CO3: Write technical report

List of experiments: Hands-on experiments related to the course contents of Power Electronics which includes at least 12 from the following:

1. Draw V-I characteristics of SCR and measure latching and holding currents
2. Study of UJT trigger circuit for half wave and full wave control.
3. Study of single-phase half wave controlled rectified with (i) resistive load (ii) inductive load with and without freewheeling diode.
4. Study of single phase (i) fully controlled (ii) half-controlled bridge rectifiers with resistive and inductive loads
5. Study of three - phase fully/half-controlled bridge rectifier with resistive and inductive loads.
6. Study of single-phase ac voltage regulator with resistive and inductive loads.
7. Study of single phase cycloconverter with resistive (R) and inductive (RL) loads.
8. Study of triggering of (i) IGBT (ii) MOSFET (iii) power transistor
9. Study of operation of IGBT/MOSFET chopper circuit
10. Study of MOSFET/IGBT based single-phase series-resonant inverter.
11. Study of MOSFET/IGBT based single-phase bridge inverter.
12. Forced commutation circuits (Class A, Class B, Class C, Class D and Class E)
13. Single Phase Series Inverter with R & RL loads
14. Single Phase Parallel Inverter with R& RL loads

Course Code	Course Title	Hours per week L-T-P	Credit C
EI181513	Microprocessors Lab	0-0-2	1

Prerequisites:

- Microprocessor 8085 and applications.

COURSE OUTCOMES:

After the successful completion of the course student should be able to:

CO1: To define the basic concept of programmable device and structural arrangement of 8085 and its instructions.

CO2: To define the general idea for interfacing memory devices and I/O devices to ensure unique address for each device

CO3: To define the basic concept of PPIs and their operational aspects.

CO4: To apply the knowledge of PPIs for different engineering applications

CO5: To demonstrate the basic evolutionary process leading to the development of microprocessor based system for a few practical applications

LIST OF EXPERIMENTS

Experiment 1: Familiarization of the Microprocessor Kit – (a) editing a program (b) Verifying the program (c) Executing the program and verifying the outcome of the program.

Experiment 2: Developing and testing simple program for data transfer –between memory to Microprocessor or Microprocessor to memory using direct and indirect instructions.

Experiment 3: Write a program to add the data stored in memory location CA00 and CA01. Store the result in memory location CA02, if there is a carry, store 01H in the memory location CA03, and otherwise store 00H in memory location CA03.

Experiment 4: Developing and test program for transfer block of 100 data from starting location CA00 H to next block having starting location CB00 H

Experiment 5: Developing and test program for to sort a set of data in ascending order stored in memory starting at C050.

Experiment 6: Developing and test program performing addition on two numbers using interrupt RST 7.5 key.

Experiment 7: Develop and test program to blink the LED’s interfaced to port A of 8255.

Experiment 8: Develop and test simple program for key board and & segment LED operation using 8279

Experiment 9: Group project to develop traffic light control program using the traffic light control

Note: Laboratory experiments are to be conducted using instruction sheets provided by the instructor

Detailed Syllabus:

Course Code	Course Title	Hours per week L-T-P	Credit C
EE181601	Power System-III	3-1-0	4

Course Outcomes (COs): After the successful completion of the course student should be able to:

CO1. Understand the concept of modern power system after restructuring along with the concept of smart grid

CO2. Recognize and classify any substation or switchgear equipment. Understand its necessity, the function it serves and comprehend the advantage it affords to the whole system.

CO3. Understand use of fuses and circuit breakers in protecting the system, compare different types based upon medium of arc interruption and voltage levels. Understand theories and ratings of circuit breaker; analyze phenomenon of current chopping and interruption of capacitive current and the testing procedures. Be capable of selecting proper fuse ratings and CB's for protection for different equipment and voltages.

CO4. Understand use of relays their function and types. Comprehend and analyze different relays e.g. over-current, distance, differential etc used for protection of alternators, transformers, transmission lines and get a brief overview of carrier current protection schemes.

CO5. Understand and recognize HVAC and HVDC systems, different components, DC links, comprehend the advantages of HVDC systems and applications in different scenarios.

MODULE 1: Basic Concepts (2 Lectures)

Structure of a Power System, Bulk Power grids & Micro Power grids, Present day scenario of the system after deregulation & restructuring

MODULE 2: Static Substations (4 Lectures)

Substations: Classification. Interconnection of substations, Necessity. Function & arrangement of different substation equipment

Bus bar arrangements: selection criteria, single line diagram of single, duplicate, sectionalized, one & half CB, ring & mesh arrangements

Current limiting reactors: Types and construction, Location of reactors, substation grounding

MODULE 3: Fuses & Circuit Breakers (9 Lectures)

Fuses: Definition & Function. Important terms & classification. HRC fuses, Characteristics & advantages. Time delay fuses. Selection of fuses

Circuit breakers: Definition & Function, principles of circuit breaking. DC & AC circuit breaking theory, Arc voltage and current waveforms. Analysis of Restriking & Recovery voltages. Theories of Arc interruption. Phenomena of current chopping & capacitive current breaking. ACCB ratings. Working principle, construction, advantages & disadvantages of-Bulk oil CB & MOCB, Air CB, Air Blast CB, Vacuum CB&SF₆CB. Testing of circuit breakers

MODULE 4: Protective Relays (9 Lectures)

Definition. Terminology & functional characteristics of Protective relays. Universal Relay-Torque equation. **Operating principles of:** Over current relays. Differential relays. Distance

relays. Feeder, generator & transformer protection. Power Swing analysis & effect on distance relays. Carrier current protection. Comparators.

Static relays: operating principles, types & advantages. Block diagrams.

Numerical relays: operating principles, types & advantages. Block diagrams

MODULE 5: Over Voltage Phenomena, Protection & Insulation Co-Ordination

(12 Lectures)

Lightning phenomena, switching surges, Travelling waves, Shape and specification of travelling waves, Attenuation and distortion of travelling waves, Attenuation due to Corona, Behavior of travelling waves at a line transition

Introduction to Insulation coordination. Volt-time curve. Important terminology. BIL & factors affecting it. Coordination of system equipment. Overvoltage protection. Terms used. Ground wires, tower footing resistance & counterpoises. Different types of lightning arresters & surge absorbers. Location & rating of lightning arresters

MODULE 6: HVDC Transmission and Systems

(4 Lectures)

Limitations of HVAC transmission. Advantages & limitations of HVDC transmission. Kinds of DC links. Ground return. Equipment for HVDC transmission. Application of HVDC systems. Advantages and Limitations of using high transmission voltages

Textbooks/ Reference Books:

1. Electrical Power - S.L. Uppal
2. Electrical Power Systems - C.L. Wadha
3. Switchgear & Protection - S.S. Rao
4. Power System Protection & Switchgear - B. Ram & D.N. Vishwakarma
5. HVDC Power Transmission Systems – K.R.Padiyar
6. Electrical Power System Design - M.V. Despande
7. Switchgear Principles - P.H.J. Crane
8. Power System Protection and Switchgear- B. Ojha
9. Power System Protection- P. M. Anderson

Course Code	Course Title	Hours per week L-T-P	Credit C
EE181602	Electric Drives	3-0-0	3

Course Outcomes (COs): At the end of the course, the student will be able:

CO1: To differentiate among various types of electric drives their dynamics and apply them for industrial applications

CO2: To choose an appropriate value of resistance for starting of motors and braking of electric motor

CO3: To apply the relations of heating and rating of a motor for choosing type and size of motor and enclosures suitable for different applications

CO4: To apply power electronics circuits for control of electric drives and to design simple systems for closed loop control of drives

CO5: To analyse different kind of processes involved in drives used in industries

MODULE 1: Dynamics of Electric drives (5 hours)

Classification of electric drives, types of load, speed-torque characteristics of loads and motors, selection of motors, dynamics of motor- load combination, four-quadrant operation, moment of inertia, stability of electric drives

MODULE 2: Starting and Braking of Electric Motors (10 hours)

Effect of starting on power supply, motor and load, starting methods, automatic starting circuits: time and current limit acceleration, energy relations and reduction of energy loss during starting. Braking methods, speed-torque characteristic under braking conditions, energy relations during braking

MODULE 3: Heating & Rating and Mechanical Features for Electrical Motors (5 hours)

Heating and cooling of motors, loading condition and classes of duty, power rating and selection of motors for different applications, load inertia and load equalization.

Types of enclosures, bearings, mountings and transmission of drive, reduction of noise

MODULE 4: Multi-Quadrant DC Drive (8 hours)

Review of motoring and generating modes operation of a separately excited dc machine, single-quadrant, two-quadrant and four-quadrant choppers; steady-state operation of multi-quadrant chopper fed dc drive.

Control structure of DC drive, inner current loop and outer speed loop, dynamic model of dc motor – dynamic equations and transfer functions, modeling of chopper as gain with switching delay, plant transfer function, for controller design, current controller specification and design, speed controller specification and design

MODULE 5: Induction Motor Drives (8 hours)

Review of three-phase voltage source inverter, generation of three-phase PWM signals, sinusoidal modulation.

Speed control of 3 phase Induction Motors - Stator control: PWM &V/f control, Rotor control: rotor resistance control, Static control of rotor resistance using DC chopper, Static Kramer and Scherbius drives, Introduction to Vector Controlled Induction Motor Drives

MODULE 6: Synchronous Motor and BLDC Motor Drives**(4 hours)**

Speed control of 3 phase Synchronous Motors - True synchronous and self-controlled modes of operation, **PMSM**: principle, flux-density distribution, types. BLDC motor: Principle, drive scheme, converter topologies

Textbooks:

2. G. K. Dubey, -Fundamentals of Electrical Drives, CRC Press, 2002

References:

1. G. K. Dubey, -Power Semiconductor Controlled Drives, Prentice Hall, 1989
2. R. Krishnan, -Electric Motor Drives: Modeling, Analysis and Control, Prentice Hall, 2001
3. W. Leonard, -Control of Electric Drives, Springer Science & Business Media, 2001

Course Code	Course Title	Hours per week L-T-P	Credit C
EE181603	Electromagnetic Field Theory	3-0-0	3

Course Outcomes (COs): After the successful completion of the course student should be able to:

CO1: To differentiate different types of coordinate systems and use them for solving the problems of electromagnetic field theory

CO2: Apply vector calculus and formulate potential problems within electrostatics, magnetostatics and stationary current distributions in linear, isotropic media

CO3: Apply Poisson's and Laplace's Equation in solving complex problems in simple geometries using separation of variables and the method of images

CO4: Analyze Maxwell's equation in different forms and apply them to examine the phenomena of wave propagation in different media and its interfaces for diverse engineering problems

CO5: Applications in different fields of communication and analyze the nature of electromagnetic wave propagation in transmission line problems

MODULE 1: Vector Analysis (3 Lectures)

Review of dot and cross products, gradient, divergence and curl. Divergence and Stoke's theorem, Cartesian, Cylindrical and Spherical co-ordinates system. Transformation between co-ordinates, General curvilinear co-ordinates. Value of gradient divergence and curl in general co-ordinates and to obtain there from their values in cylindrical and spherical co-ordinates.

MODULE 2: The Static Electric Field (9 Lectures)

Coulomb's Law, Electric Field strength, Field due to point charges, a line charge and a sheet of charge, field due to continuous volume charge, electric flux density, Gauss's law in integral form, Gauss's law in differential form (Maxwell's first equation in electrostatics), applications of the Gauss's law. Electrostatic potential difference and potential, potential and potential difference expressed as a line integral, potential field of a point charge, potential field of a system of charges, conservative property, potential gradient, the dipole, energy density in the electrostatic field

MODULE 3: The Static Magnetic Field (7 Lectures)

The Biot-Savart's law (the magnetic field of filamentary currents), the magnetic field of distributed surface and volume currents, ampere's circuital law in integral and differential form (Maxwell's curl equation for steady magnetic field)

The scalar and vector magnetic potentials, Maxwell's Divergence equation for B, steady magnetic field laws, forces in magnetic field, force on a current element, force between two current elements, force and torque in a current loop

MODULE 4: The Electromagnetic Field (8 Lectures)

Faraday's law in integral and differential form (Maxwell's first curl equation for electromagnetic field). The Lorentz force equation. The concept of displacement current and modified ampere's law (Maxwell's 2nd curl equation for electro- magnetic field), the continuity equation, power flow in an electromagnetic field, the poynting vector. Sinusoidally time varying fields, Maxwell's equation for Sinusoidally time varying fields, Power and energy considerations for

Sinusoidally time varying fields. The retarded potentials, polarization of vector fields, review of Maxwell's equations.

MODULE 5: Materials and Fields

(2 Lectures)

Current and current density, the continuity equation, conductor in fields. Dielectrics in fields: Polarization, flux density, electric susceptibility, relative permittivity, boundary conditions in perfect dielectrics, magnetic materials, magnetization, permeability, boundary conditions

MODULE 6: Applied Electromagnetic-I

(3 Lectures)

Poisson's and Laplace's equations, solution of one-dimensional cases, general solution of Laplace's equation, method of images

MODULE 7: Applied Electromagnetic-II

(8 Lectures)

Electromagnetic waves, the Helm Holtz Equation, wave motion in free space, wave motion in perfect lossy dielectrics, propagation in good conductors, skin effect. Reflection of uniform plane waves. Radiation of electromagnetic waves

Textbooks/Reference Books:

1. Engineering Electromagnetics: W H Hyat and J A Buck
2. Principles of Electromagnetics: N O Sadiku
3. Elements of Electromagnetic Fields: S P Seth
4. N. N. Rao: Basic Electromagnetics with applications.
5. Corson and Lofrain: Introduction to Electromagnetic Fields and waves.
6. Bradshaw and Byatt: Introductory Engineering Field Theory.

Course Code	Course Title	Hours per week L-T-P	Credit C
EE1816PE21	Principles of Telecommunication Engineering	3-0-0	3

Course Outcomes (COs): After completion of the course students will be able to

CO1: apply the knowledge of mathematics, engineering fundamentals, to the solution of Analog communication engineering problems

CO2: demonstrate and apply the knowledge of multiplexing for communication

CO3: design circuits with the concepts of Pulse Modulation Techniques for different applications

CO4: apply the knowledge to detect and correct the errors that occur due to noise during transmission

CO5: apply knowledge to demonstrate ability to function in the field of digital communication

MODULE 1: Introduction to Communication Issues (6 Lectures)

History of communication, Issues of noise in communication, Sources and characteristics of different noise, thermal and shot noise, concept of white Gaussian noise. Noise temperature, noise bandwidth and noise figure

MODULE 2: Amplitude Modulation (8 Lectures)

Concept and need of Modulation, Generation and detection of Amplitude Modulation- AM-DSBFC, DSBSC, SSB, Square Law modulation, switching modulator, square law demodulator, Envelop detector, Balance Modulator, Power spectra of AM

MODULE 3: Angle Modulation (8 Lectures)

Generation and detection of Frequency and Phase Modulation – NBFM, WBFM, Transmission bandwidth, Indirect and direct method for FM generation, Frequency discrimination, PLL demodulation, Super heterodyne receivers, Frequency Division Multiplexing

MODULE 4: Random Signal Theory (4 Lectures)

Random variable – cumulative distribution function, probability distribution function, statistical averages, normal distribution, standard deviation, Gaussian and Rayleigh PDF

MODULE 5: Pulse Modulation (8 Lectures)

PAM, PPM, PWM systems, Sample and hold circuit, Concept of PCM- generation and reconstruction, basic coding and quantization, quantization noise, non-uniform quantization and companding, signal to quantizing noise power ratio, Signaling Format, Time Division Multiplexing

MODULE 6: Digital Communication Systems (6 Lectures)

Generation and detection of ASK, PSK, FSK. Applications of Digital Communication Systems

Textbooks:

1. Modern Digital and Analog Communication System, B.P.Lathi, Oxford University press, India
2. Communication Engineering, Sanjay Sharma, S.K.Kataria & Sons

Reference Books:

1. Communication System, Simon Haykins, John Wiley & Sons
2. Communication System, V. Chandrasekar, Oxford University press, India

Course Code	Course Title	Hours per week L-T-P	Credit C
EE1816PE22	Embedded System	3-0-0	3

Course Outcomes (COs): After the successful completion of the course student should be able:

CO1: To define the basic concept and function of programmable device and structural arrangement of such device

CO2: To demonstrate the architecture of 8051 with special reference to the instructions available for software development

CO3: To define use of SFRs for vector interrupts for timer and serial data transfer operations

CO4: To apply the knowledge of microcontroller in the development process of embedded system. Such as, key board, display unit and application based interfaced system according to the task of the system

CO5: To apply the knowledge of Advanced Microcontroller for the development of embedded systems

MODULE 1: Introduction (5 Lectures)

Introduction to Programmable device, concept of common BUS, operation of a programmable device, design and realization of a simple programmable device Microcontroller/Microprocessor) with simple instructions like – data transfer, ALU operations, port operation etc. History of Microcontroller and Microprocessor. Difference between Microcontroller and Microprocessor. MPU of different categories- such as Microcontroller-8051, AVR etc, their specific features, advantages

MODULE 2: Microcontroller 8051 (3 Lectures)

Introduction. MCS-51 Architecture. Registers, I/O Ports. Memory organization. Hardware interrupts, Timer and Serial input/out

MODULE 3: Assembly and C Programming of Microcontroller 8051 (10 Lectures)

Instructions- Addressing modes, Arithmetical. Logical. Jumps. Loops and Call etc. Interrupts, Timers/ Counters and Serial Communications

MODULE 4: Application of MCS-51 (10 Lectures)

Interfacing LCD., Key board, principle DAC and ADC-Multi-channel programmable parallel data BUS ADC, Multi-channel programmable SPI base ADC. Basic features of an embedded system used for real-time practical application. Data- logger. Development of instrumentation system for measurement of - light intensity, temperature, pressure, flow, frequency, pulse width, voltage, angular speed etc. Generation of PWM wave. PID controller, analytical instruments such as Sequential control and interlock control

MODULE 5: Introduction to AVR ATmega 8/16/32 (12 Lectures)

Introduction to AVR ATmega 8/16/32, Basic port operation, configuration in-built ADC for sampling analog signal, serial data communication thorough TxD and RxD. fundamental of timer operations and EEPROM data read write operation

Textbooks:

1. Microcontrollers: Theory and Applications – by A V Deshmukh
2. The 8051 Microcontroller and Embedded system using assembly and C. – Md Ali Mazidi, Rolin D. Mc-Kindly and Janice Gillistie.
3. The AVR Microcontroller and Embedded using assembly and C. - Md Ali Mazidi, Sarmad Naimi and Sepehr Naimi

Course Code	Course Title	Hours per week L-T-P	Credit C
EE1816PE23	Optimal and Adaptive Control System	3-0-0	3

Course Outcomes (COs): After completion of the course students will be able to

CO1: formulate mathematical models of optimal and adaptive control problems

CO2: analyze stability of optimal and adaptive control systems

CO3: design optimal and adaptive control systems to meet desired specifications

MODULE 1: Basic Approaches (2 Lectures)

Basic approaches to adaptive control; Applications of adaptive control

MODULE 2: Gradient and Least-Squares Algorithms (9 Lectures)

Linear error equation. Gradient and normalized gradient algorithms. Least-squares algorithms (batch, recursive, recursive with forgetting factor). Convergence properties

MODULE 3: Identification (8 Lectures)

Identification of linear time-invariant systems. Adaptive observers. Sufficient richness condition for parameter convergence. Equation error and output error methods

MODULE 4: Indirect Adaptive Control (7 Lectures)

Pole placement adaptive control. Model reference adaptive control Predictive control. Singularity regions and methods to avoid them

MODULE 5: Optimal Control (14 Lectures)

Formulation of optimal control problem. State regulator problem. Output regulator problem. Tracking problem, Continuous-Time Linear Regulators, Conditions for optimality, Calculus of variations, Pontryagin's maximum principle, Hamilton Jacobi-Bellman theory, dynamic programming, structures and properties of optimal systems, various types of constraints, singular solutions, minimum time problems, optimal tracking control problem

Course Code	Course Title	Hours per week L-T-P	Credit C
EE1816OE21	Operating Systems	3-0-0	3

Course Outcomes (COs): After completion of the course students will be able to

CO1: explain the terms and definitions concerned with Operating System of modern general purpose computer

CO2: analyze the performances of Operating System of modern general purpose computer

CO3: design Operating System of modern general purpose computer

MODULE 1: Purpose of Operating Systems (OS) (1 Lectures)

Virtualization of Resources; Handling of Resource Sharing; Providing Common Services

MODULE 2: Scheduling and Process Management (7 Lectures)

Interrupts; Basics of Scheduling (Time slices, Pre-emptive Queueing, Common Scheduling Algorithms); Basics of Process Management (Context Switching, Process Swapping, Threads)

MODULE 3: Basics of Synchronization (4 Lectures)

Deadlock (Meaning and causes, common prevention mechanisms, common detection and recovery mechanisms); Critical Sections; Semaphores, Monitors; Spin Locks

MODULE 4: Virtual Memory (3 Lectures)

Basic Concept of Address Spaces; Segmentation; Paging (Working Set Concept, Common Paging Algorithms); Interactions with Hardware

MODULE 5: Caching and Buffering (7 Lectures)

Basics of cache design (Hit ratio, LRU and Other Common Cache replacement strategies); Purpose of I/O Buffers and their use

MODULE 6: Basics of OS Architecture (3 Lectures)

Kernels, Microkernels and Layering; Out-of-Kernel Services

MODULE 7: Basics of Interprocess Communications (5 Lectures)

Shared Memory Mechanisms; Messages; Remote Procedure Calls (RPCs)

MODULE 8: Basics of File Systems (2 Lectures)

Directories; Basic Issues of File System Layout on Disk; Basic File System Protection Mechanisms

MODULE 9: Basics of Security (8 Lectures)

Access control mechanisms (Access Control Lists, Capabilities); Basic Ideas of Encryption and Authentication (Fundamentals of Encryption, Keys, Digital Signatures)

Textbooks:

Andrew S. Tanenbaum: Operating Systems Design and Implementation, PHI

Reference Books:

G. Nutt: Operating Systems: A Modern Perspective, Addison-Wesley

Course Code	Course Title	Hours per week L-T-P	Credit C
EE1816OE22	Complex Analysis	3-0-0	3

Course Outcomes (COs): After completion of the course students will be able to

CO1: define spaces and explain proofs of theorems of spaces

CO2: analyze measurable functions in spaces

CO3: analyze applications of spaces and measures

MODULE 1: Space Concept (5 Lectures)

Vector spaces, Metric Spaces, Normed Spaces and Banach Spaces, Linear Operators, Inner Product and Hilbert Spaces: Basic definitions and Theorems; Examples: Sequence Spaces and Function Spaces; Dimension concept

MODULE 2: Topology of Metric Spaces (8 Lectures)

Open, Closed, Dense sets and Closures; Heine-Borel and Ascoli-Arzelà Theorems; Separability; Completeness; Compactness; Hilbert Spaces: Inner products and linear functional, Orthogonal sets, Trigonometric series; Banach Spaces: Consequences of Baire's theorem, Fourier series of continuous functions, Fourier coefficients of L^1 -functions, Hahn-Banach theorem, Uniform Boundedness theorem, Open mapping theorem, Closed mapping theorem, Closed graph theorem, Abstract approach to Poisson integral

MODULE 3: Measure and Integration (8 Lectures)

Total variation; Absolute continuity; Consequences of Radon-Nikodym theorem; Bounded linear functional on L^p -spaces; Riesz representation Theorem; Regularity properties of Borel measures; Lebesgue Measure on Euclidean Space; Measurable and Lebesgue Integrable Functions on Euclidean Space; Convergence Theorems; Comparison of Lebesgue Integral with Riemann Integral; Convex functions and inequalities; L^p -spaces; Approximation by continuous functions; General Measures and Lebesgue L^p -spaces: Importance of Lebesgue's Ideas in Functional Analysis; Continuity properties of measurable functions

MODULE 4: Analytic Functions (3 Lectures)

Basic concepts; Line integrals of complex functions; Cauchy's theorems; Residues and isolated singular points; Mappings and elementary functions

MODULE 5: Differentiation (2 Lectures)

Derivatives of measures; Fundamental theorem of Calculus; Differentiable transformations

MODULE 6: Integration on Product spaces (5 Lectures)

Measurability on Cartesian products; Product measures; Fubini theorem; Completion of product measures; Convolutions; Distribution functions

MODULE 7: Fourier Transforms (4 Lectures)

Formal properties; Inversion theorem; Plancherel theorem; Banach algebra of L^1

MODULE 8: Harmonic Functions

(5 Lectures)

Cauchy-Riemann equations; Poisson integral; Mean value property; Boundary behavior of Poisson integrals; Representation theorems; Subharmonic functions and Dirichlet's problem

Textbooks:

1. Karen Saxe: Beginning Functional Analysis, Springer
2. Walter Rudin - Real and Complex Analysis, McGraw-Hill Book Company

Reference Books:

Course Code	Course Title	Hours per week L-T-P	Credit C
EE1816OE23	Digital Image Processing	3-0-0	3

Course Outcomes (COs):

- CO1:** Understand the mathematical foundations for digital manipulation of images; image acquisition
- CO2:** Understand 2D Fourier transform concepts, including the 2D DFT and FFT, and their use in frequency domain filtering.
- CO3:** Demonstrate understanding of spatial filtering techniques, including linear and nonlinear methods. Understand the Human Visual System (HVS) and its effect on image perception and understanding
- CO4:** Understand the fundamental image enhancement algorithms such as histogram modification, contrast manipulation, and edge detection and image compression technique like JPEG and MPEG
- CO5:** Implement practical techniques to write programs using MATLAB language for digital manipulation of images; image acquisition; preprocessing; segmentation; Fourier domain processing; and compression

MODULE 1: Fundamentals of Digital Image (4 Lectures)

Human Visual System and Image perception; Monochrome and colour vision models; Image acquisition and display; Video I/O devices; Standard video formats; Image digitization; display and storage; 2D signals and systems

MODULE 2: Image Enhancement and Restoration (8 Lectures)

Spatial and frequency domain enhancement Techniques (Histogram based techniques, smoothing, filtering, sharpening, Homomorphic filtering), Unconstrained and Constrained Restoration, Inverse filtering, Wiener filter

MODULE 3: Image Compression (8 Lectures)

Coding, Interpixel and Psychovisual Redundancy; Image compression models; Error free compression – Huffman, Arithmetic and LZW, Bit-Plane coding (Constant Area coding, 1-D & 2-D Run length coding), Lossless predictive coding; Lossy compression – Lossy predictive coding, Transform coding – (Discrete Fourier Transform, Walsh-Hadamard Transform, Discrete Cosine Transform, and Discrete Wavelet Transform methods), Image compression standards – JPEG using DCT & DWT Continuous Tone Still Image Compression standard, Basics of MPEG Video Compression standard

MODULE 4: Digital Geometry and its Application in Image (8 Lectures)

Neighbourhood, connectedness, path, holes and surroundness, Borders, distances, Medial axis transformation, shrinking and expanding, thinning, Morphological operations- Erosion, Dilation, Opening, Closing, Parallel implementation, Smoothing, Component labelling, Thinning

MODULE 5: Image Segmentation (6 Lectures)

Edge detection – Roberts, Prewitt, Sobel & Laplacian Operators, Edge linking and Boundary Detection – Local Processing, Global Processing via the Hough Transform to detect straight lines and parameterised curves

MODULE 6: Representation and Description**(6 Lectures)**

Representation: Chain codes, Polygonal Approximations, Signatures, Boundary Segments, Skeletons; Boundary Descriptors – length, diameter, major axis, minor axis, basic rectangle, eccentricity, curvature, shape numbers; Application of Image Processing

Textbooks:

1. Digital Image Processing - Rafael C. Gonzalez and Richard E. Woods, Pearson., 2009, 3rd Ed
2. Fundamental of Digital Image Processing, Anil K Jain, PHI, 1994
3. Computer Vision - D H Ballard and C M Brown, PHI.
4. Digital Image Processing- S Jayaraman, S.Essakirajan, T Veerakumar, TMH

Course Code	Course Title	Hours per week L-T-P	Credit C
EE1816OE24	Optimization Techniques in Engineering	3-0-0	3

Course Outcomes (COs): At the end of the course, the student will be able to:

CO1: Analyze a decision making problem and construct a mathematical model of it

CO2: Apply classical optimization techniques to constrained and unconstrained optimization problems

CO3: Formulate and solve linear programming problems

CO4: Apply search methods to non-linear programming problems

CO5: Apply dynamic programming techniques to engineering problems

MODULE 1: Introduction

Introduction to optimization, Engineering Applications of optimization, Formulation of problems as mathematical programming problems, classification of optimization problems

MODULE 2: Classical Optimization Techniques

Single variable optimization, Multivariable optimization without constraints: necessary and sufficient conditions, Multivariable optimization with equality constraints: Lagrange's multiplier method; Multivariable optimization with inequality constraints: Kuhn Tucker conditions

MODULE 3: Linear Programming

Formulation of LPP, Graphical and simplex method of solution of LP problems, Duality in LP, Sensitivity analysis

MODULE 4: Non-linear Programming

Unconstrained algorithms: One-dimensional minimization methods, Direct search and Gradient methods; Constrained algorithms, Quadratic programming

MODULE 5: Dynamic Programming

Multi-stage decision process, Structure and characteristics of dynamic programming, principles of optimality, deterministic dynamic programming

Textbooks:

1. Engineering Optimization Theory & Applications, S.S. Rao, New Age International Pvt. Ltd.
2. Mathematical programming-Theory and Applications, S.M.Sinha, Elsevier

Reference Books:

1. Optimization Concepts and Applications in Engineering-A.D. Belegundu, T.R. Chandrupatia, Perason Education, Asia
2. Operations research- An Introduction-Taha, H.A. Pearson

Course Code	Course Title	Hours per week L-T-P	Credit C
HS181606	Accountancy	2-0-0	2

MODULE 1:

Concept and classification of Accounts, Transaction, Double Entry system of Book Keeping, Golden rules of Debit and Credit, Journal- Definition, advantages, Procedure of Journalising, Ledger, advantages, rules regarding Posting, Balancing of Ledger accounts, Trial Balance- Definition, objectives, procedure of preparation

MODULE 2:

Name of Subsidiary Books, Cash Book-definition, advantages, objectives, types of Cash Book, preparation of different types of cash books, Bank Reconciliation Statement, Reasons of disagreement between Cash Book with Pass Book balance, preparation of Bank Reconciliation Statement

MODULE 3:

Final Account: Preparation of Trading Account, Profit and Loss Account with adjustments

MODULE 4:

Concept of Capital Expenditure and revenue Expenditure, Baddebts, Provision for Bad and Doubtful debts, Provision for discount on Debtors, Outstanding expenses, Prepaid expenses, Accrued Income

MODULE 5:

Introduction to Depreciation Accounting- Meaning, causes, factors, methods of charging depreciation etc.

Textbooks/Reference Books:

1. Theory and Practice of accountance- KR Das, KM Sinha, KS Pal Choudhury, Dr. A Rahman, PK Pujary
2. Book- Keeping & Accountancy- C Mohan Juneja, J R C Chawla, KK Sakseena
3. Double Entry Book- Keeping & Accountancy- JR Batliboi

Course Code	Course Title	Hours per week L-T-P	Credit C
EE181611	Power System Lab	0-0-2	1

Course Outcomes (COs): After the successful completion of the course student will be able to:

CO1: develop models for study of power flow, transients, stability, contingency, unit commitment, economic dispatch, protection in respect of a given power system

CO2: analyze power flow, transients, stability, contingency, unit commitment, economic dispatch, protection in respect of a given power system through simulation in computer and test kits

CO3: write technical report

EXPERIMENTS

Power System Lab should contain softwares like CYME, MI Power, MATLAB, LABVIEW, C++ and Numerical Relay based Transformer, Generator, Motor and Transmission lines (short, medium, long) with provision of at least dual supply (with automatic and manual synchronization facility) from grid and alternator and/or 3-phase inverter from battery

Sl. No.	Contents
1	Power flow analysis by Newton-Raphson method and Fast decoupled method
2	Transient stability analysis of single machine-infinite bus system using classical machine model
3	Contingency analysis: Generator shift factors and line outage distribution factors
4	Economic dispatch using lambda-iteration method
5	Unit commitment: Priority-list schemes and dynamic programming
6	Analysis of switching surge using EMTP: Energization of a long distributed-parameter line
7	Analysis of switching surge using EMTP: Computation of transient recovery voltage
8	Familiarization of Numerical Relay Test Kit
9	Simulation and Implementation of Voltage Source Inverter
10	Numerical Relay Setting: Protection of Transmission Lines, Alternator, Transformer and Motor simulating all types of faults
11	Co-ordination of Numerical over-current and distance relays for radial line protection

Textbooks:

1. Electrical Power Systems 6th Ed 2012 – C. L. Wadhwa, New Age International
2. Power System Protection and Switchgear 2nd Ed 2011 - Badri Ram and D. Vishwakarma, McGraw Hill

Reference Books:

7. Power System Analysis and Design 2005 – B. R. Gupta, S. Chand & Co.
8. Switching, Protection and Distribution in Low-Voltage Networks: Handbook with selection criteria and planning guidelines for switchgear, switchboards, and distribution systems 2nd Ed 1994 – Siemens, Wiley VCH.
9. HVDC Power Transmission Systems – K. R. Padiyar
10. Electrical Power System Design - M.V. Deshpande

Course Code	Course Title	Hours per week L-T-P	Credit C
EE181614	Electronics Design Lab	0-1-4	3

Course Outcomes (COs): After the successful completion of the course student will be able to:

CO1: design electronic systems to meet the requirements of society, academia and industry

CO2: analyze the performance of electronic system after completion of its design

CO3: write technical report after completion and testing of electronic system

[1 (One) mini project or at least 2 (two) advance level design type experiments may be carried out in the following mixed or single categories; One or more quiz tests or class tests may be taken to assess and motivate the students]

Electronics Design Lab should have softwares like MATLAB Simulink, Microsim, Proteus, PSPICE, LABVIEW, Xilinx, VHDL, Verilog HDL; and hardwares like Microprocessor based system development kit, Microcontroller based system development kit, FPGA based system development kit like Xilinx and Vivado

Sl. No.	Title	Topics in the Module	No. of Lectures	No. of Practical hours
1	Microprocessor based design	Develop a microprocessor based system for smart home or industrial control	1	9
2	Microcontroller based design	Develop a microcontroller based system for smart home or industrial control	1	9
3	FPGA based design	Develop a FPGA based system for smart home or industrial control: Use Xilinx system	4	10
4	Testing of designed electronic system	Perform the desired tests and quality checks. Perform market surveys for outsourcing the developed electronic systems. Write technical reports on the developed electronic systems including the feedback from the sites of utility	1	5

Detail Syllabus:

Course Code	Course Title	Hours per week L-T-P	Credit C
EE181701	Power System-IV	3-1-0	4

Prerequisites: Electric Power System –I, Electric Power System – II, Electric Power System - III

Course Objectives:

The objective of this course is to provide students with a broad understanding of electricity generation by conversion of various forms of energy to electrical energy and associated technology, operation and decision making on power plants. Provide a detailed study on the analysis and economic related issues in power sectors. The impact of this course offers a wide understanding on the different types of power plant, its functions and their flow lines and issues related to them

Course Outcomes:

CO1: Identify various characteristics of thermal and hydal plants and to solve various kinds of economic dispatch problems as well as UC problem

CO2: Make use of various modes of hydro-thermal scheduling and to prepare short term hydro thermal schedules

CO3: Comprehend the concept of Power System interconnection and economics of interconnected system

CO4: Apply generation control techniques in single area and multi area experimenting LFC, AVR and AGC

CO5: Utilize knowledge of State Estimation in power system and IEEE study model

MODULE 1: Power Plants- *Thermal power plant* – Economical, and ecological issues. Line diagram of thermal power plant Boiler: classifications and operational issues, Super heater, Reheaters, Economizer, air heater, draft system, feed water heater, and evaporator, cooling water supply and cooling tower. Speed governor, station auxiliaries, Ash handling system for thermal power plant. Emission issue of thermal power plant.

Hydro power plant- Classification of hydro power plant, economic and ecological issues related to the selection of site of hydro power plant, Estimation of generation capacity of hydro power plant, Selection of turbine, plant layout, governor and hydro plant auxiliaries.

Nuclear power plant- Fundamental of nuclear fission, schematic of nuclear power plant, nuclear fuels and fertile materials, nuclear reactor, chain reaction, moderator, coolants, control of fission, reactor operation, types of reactors, economical, and ecological issues of nuclear power plant.

Other power plants- Solar PV power plant, principle and operation, standalone Solar PV power plant, Grid Connected Solar PV power plant, Wind power plant etc.

MODULE 2: Economic Operation of Thermal plants- Methods of loading turbo-generators, input-output curves, heat ratio and incremental cost, coordination equation, economic loading of units, with and without transmission loss, penalty factor, iterative methods of solving co-ordination equation, economic thermal dispatching with network losses considered, B-matrix loss formula and its derivatives, economic dispatch versus unit commitment(UC), constraints in UC, UC solution method, generation Scheduling, ,introduction to load forecasting.

MODULE 3: Automatic load frequency and voltage control- Concept of load frequency control (LFC), LFC model for single/multi area systems, tie-line control in interconnected system (multi area system), concept of voltage & reactive power control.

Textbooks/ Reference Books:

2. GK Nagpal, Power Plant Engineering, Khanna Publishers.
3. B.R. Gupta, Generation of Electrical Energy, S Chand and Company.
4. M.V. Despande, Elements of Electrical Power System Design, A.H. Wheeler.
5. S.L. Uppal, Electrical Power, Khanna Publishers.
6. Prabha Kundur Power System stability & control

Course Code	Course Title	Hours per week L-T-P	Credit C
EE1817PE31	High Voltage Engineering	3-0-0	3

Course Objective: To introduce theory of high voltage breakdown phenomena and testing of insulation strength of dielectrics

Course outcomes: At the end of the course the students will be able to:

CO1: Analyze breakdown of dielectrics

CO2: Design generation of high voltage for testing insulation strength

CO3: Analyze performance of high voltage testing and measurement methods

MODULE 1: Breakdown of Gasses

Basic processes in gas breakdown, generation of electron avalanche, Townsend mechanism, secondary processes, criterion for spark breakdown, Streamer mechanism, time lag for spark breakdown, breakdown in electro negative gasses.

MODULE 2: Breakdown in Liquid Dielectrics

Liquid dielectric, origin, electrical conduction and breakdown phenomena of pure liquids, test cells, natural and induced conduction, Transformer oil; properties, purification.

MODULE 3: Breakdown in Solid Dielectrics

Intrinsic and related forms of breakdown in solids, measurement of intrinsic strength- preparation of the specimen, surface discharge phenomenon, positive and negative Lichtenbury patterns, discharge detection, breakdown of solid insulation by Tracking, lightning phenomena-nature and characteristic of lightning induced voltage, measuring instruments and devices, lightning protection.

MODULE 4: Generation of High Voltage

High voltage testing transformers, cascaded transformers, high frequency transformers, tesla coil, cascaded rectifier for DC high voltage, electrostatic generators, impulse generator; analysis of the basic circuit, multi-stage circuits, factors influencing design, general construction, triggering, synchronization of operation, delay cables.

MODULE 5: High Voltage Testing

Low frequency direct current, high frequency and impulse tests, terminology; disruptive discharge, flashover and puncture, withstand voltage, 50% disruptive discharge voltage, impulse wave, full and chopped wave, impulse ratio, volt-time curve; testing of overhead insulators, bushings, cables, arrangement of the test object, various tests and test conditions.

MODULE 6: High Voltage Measurements and Testing: Electrostatic voltmeters, potential dividers; resistive, capacitive and mixed resistive dividers, peak voltage measuring device, oscillographic measurements, Schering bridge, sphere and rod gaps. Types of High Voltage Tests; High Voltage Testing (Impulse) Transformers; Voltage Control by Variation of Alternator Field Current, Tapped Transformers; Induction Regulators; Control Gear and Protective Devices; Equipment for Voltage Measurement, Measurement of R.M.S., Peak, and Instantaneous Values of Voltages; Low Frequency High Voltage Tests; High Voltage D.C. Tests; High Voltage D.C. Testing of Cables; Localization of Faults in H.V. Cables; High Frequency H.V. Testing; Surge Testing; Basic Impulse Generator; Testing of Insulating Material; Impulse Testing of Transformer; H.V. Testing of Cables; Testing of Strength of Insulating Oils; High Voltage Testing of Porcelain Insulators.

MODULE 7: Insulation Design Principle

Classification of insulating materials, material of dielectric in parallel, dielectric hysteresis, high voltage cables, thermal and electrical cables, requirements of cable design, materials used, high voltage bushing types, basic applications, insulation of high voltage transformers.

MODULE 8: High Voltage Laboratory

HV plants and apparatus, HV connections, laboratory earthing and safety measures.

4. High Voltage Engineering 3rd Ed 2012 – C. L. Wadhwa, New Age International
5. High Voltage Engineering Fundamentals 2nd Ed 2008 – E. Kuffel, W. S. Zaengl and J. Kuffel, Elsevier
6. A Course in High Voltage Engg- R. S. Jha, Dhanpat Rai
7. An Introduction to High Voltage Experimental Technique 1978 – D. Kind, John Wiley & Sons

Course Code	Course Title	Hours per week L-T-P	Credit C
EE1817PE32	Computer Networks	3-0-0	3

COURSE OBJECTIVES:

- To teach the basics of the working of the Internet.
- To teach fundamentals of the protocols involved in the working of various layers of the Internet.

COURSE OUTCOMES:

At the end of this course, the students will be able:

CO1: To Understand the Basics of the Working of the Internet.

CO2: To Study Various Internet Protocols.

CO3: To Understand Various Security Measures in Internetworking.

CO4: To Understand Various Uses of Computer Networking.

MODULE 1: Introduction to Internet

- To study Topology of Internet.
- To study structure of Internet, Internet standards and Internet administration.
- To study protocol layering.

MODULE 2: The Physical Layer

- To learn Information Theory.
- To learn coding of data, conversion methods between various types of data and multiplexing techniques.
- To learn about various transmission media.
- To learn about Circuit Switching, Packet Switching and various switches.

MODULE 3: The Data Link Layer

- To learn error detection and correction techniques.
- To learn DLC protocols.
- To learn MAC protocols.
- To learn various wired and wireless LAN protocols.
- To learn mobile telephone protocols.
- To learn satellite systems.

MODULE 4: The Network Layer

- To learn packet switching methods.
- To learn congestion control techniques.
- To learn IP, IPv4, ICMPv4,
- To learn Unicast Routing and Multicast Routing
- To learn about IPv6 and ICMPv6,

MODULE 5: The Transport Layer

- To learn about transmission layer issues protocols.
- To learn about UDP, TCP-IP, SCTP

MODULE 6: The Application Layer

- a) To learn basics of WWW, HTTP, FTP, E-Mail and DNS
- b) To learn issues concerning multimedia in Internet.
- c) To learn basics of Internet Security.

Textbooks/ Reference Books:

- 1. Computer Networking:: Stallings :: TMH
- 2. Computer Networks:: Tannenbaum :: PHI
- 3. Data Communication and Networking :: Forouzan :: McGraw Hill India

Course Code	Course Title	Hours per week L-T-P	Credit C
EE1817PE33	Pattern Recognition and Machine Learning	3-0-0	3

COURSE OBJECTIVES:

To teach concepts of inculcating artificial intelligence in machines by different computational methods

COURSE OUTCOMES: At the end of this course, the students will be able to

CO1: describe structure, components and mathematical formulation of learning by machines

CO2: develop algorithms for learning and pattern recognition by machines

CO3: analyze performances and characteristics of machine learning and pattern recognition algorithms for utilization in societal, academic and industrial purposes

MODULE 1: Introduction to Machine Learning

Intelligent Machines, Data Representation, Diversity of Data, Forms of learning, Machine learning and data mining, Linear Algebra and Machine Learning Techniques

MODULE 2: Supervised Learning

Learning from observation, Bias and Variance, Computational Learning Theory, Estimating Generalization errors, Metrics for assessing regression, Metrics for assessing classification

MODULE 3: Statistical Learning

Descriptive Statistics in learning Techniques, Bayesian Reasoning, k-Nearest Neighbour (kNN) Classifier, Discriminant functions and Regression functions, Linear Regression with Least Square Error criterion, Logistic Regression for Classification Tasks

MODULE 4: Learning with Support Vector Machine (SVM)

Linear Discriminant Function for binary classification, Linear Maximal Margin classifier for overlapping classes, Non Linear classifier, Regression by SVM, Variants of basic SVM Techniques

MODULE 5: Learning with Neural Networks

Cognitive Machines, Neuron Models, Network Architectures, Perceptrons, Linear Neurons, Error correction delta Rule, Multilayer perceptron (MLP) networks, Radial Basis Function (RBF) networks, Genetic Neural Systems

MODULE 6: Fuzzy Inference System

Cognitive Uncertainty and Fuzzy Rule Base, Fuzzy Quantification of Knowledge, Fuzzy Rule Base and Approximate Reasoning, Mamdani Model, Neuro Fuzzy Inference model, Genetic Fuzzy Systems

MODULE 7: Data Clustering and Data Transformation

Unsupervised Learning, Engineering Data, Overview of basic clustering models, K-Means Clustering, Fuzzy k-means clustering, some useful data transformation, Introduction to PCA, Decision Tree Learning, Measuring of Impurity for evaluating Splits in Decision Trees, Pruning Decision Trees, Strengths and weaknesses of Decision Tree Approach

MODULE 8: Application of Machine Learning

Some Practical Application Implementation

Course Code	Course Title	Hours per week L-T-P	Credit C
EE1817PE34	Speech Coding Techniques	3-0-0	3

Pre-requisite: Digital Signal Processing

Course Outcomes: At the end of the course the student will be able to

1. Model the speech signal
2. Analyze the quality and properties of speech signal.
3. Analyze quality of the processed speech signals.

MODULE 1: Speech Production and Modeling

Human Auditory System; General structure of speech coders; Classification of speech coding techniques – parametric, waveform and hybrid; Requirements of speech codecs–quality, coding delays, robustness

MODULE 2: Speech Signal Processing

Pitch-period estimation, all-pole and all-zero filters, convolution; Power spectral density, periodogram, autoregressive model, autocorrelation estimation

MODULE 3: Linear Prediction of Speech

Basic concepts of linear prediction; Linear Prediction Analysis of non-stationary signals –prediction gain, examples; Levinson-Durbin algorithm; Long term and short-term linear prediction models; Moving average prediction.

MODULE 4: Speech Quantization

Uniform quantizer, optimum quantizer, logarithmic quantizer, adaptive quantizer, differential quantizers, Adaptive Huffman coding, Arithmetic coding, LZW coding, Psychoacoustic model, Perceptual coding and masking techniques;

Vector quantization – distortion measures, codebook design, codebook types

MODULE 5: Scalar Quantization of LPC

Spectral distortion measures, Quantization based on reflection coefficient and log area ratio, bit allocation; Line spectral frequency – LPC to LSF conversions, quantization based on LSF

MODULE 6: LPC Model

LPC model of speech production; Structures of LPC encoders and decoders; Voicing detection; Limitations of the LPC model

MODULE 7: Code Excited Linear Prediction

CELP speech production model; Analysis-by-synthesis; Generic CELP encoders and decoders; Excitation codebook search – state-save method, zero-input zero-state method; CELP based on adaptive codebook, Adaptive Codebook search; Low Delay CELP and algebraic CELP

MODULE 8: Speech Coding Standards

An overview of ITU-T G.726, G.728, G.729, MPEG Audio layers, Dolby AC3 standards

Textbooks/ Reference Books:

1. Speech Coding Algorithms: Foundation and Evolution of Standardized Coders - W.C. Chu, Wiley Inter science, 2003.
2. Fundamentals of Acoustics 4th Edition – L. E. Kinsler, A. R. Frey, A. B. Coppens, J. V. Sanders, John Wiley & Sons, 2005.
3. Discrete-Time Speech Signal Processing - Thomas F. Quatieri, Pearson Education, 2002.
4. Fundamentals of Speech Recognition – L. Rabiner, B-H Juang, B. Yegnanarayana, Pearson.
5. Digital Processing of Speech Signals – L. R. Rabiner, R. W. Schafer, Pearson, 1993.
6. Speech Communication Human and Machine – D O 'Shaughnessy, Universities Press (India) Pvt Ltd, IEEE2001.
7. Speech and Language Processing - Daniel Jurafsky & James H.Martin, Pearson Education, 2000.
8. Spoken Language Processing - Xuedong Huang, Alex Acero, Hsiad, Wuen Hon, Prentice Hall, 2001.
9. Computer Speech – Recognition, Compression, Synthesis - M.R.Schroeder, Springer Series in Information Sciences, 1999.
10. Discrete Time Signal Processing - A. V. Oppenheim and R.W. Schafer, PHI, 1992.
11. Digital Speech by A. M. Kondoz, 2nd Edition, Wiley Students Edition, 2004.
12. Speech and Audio Signal Processing - B.Gold and N.Morgan, John Wiley & Sons, 2000

Course Code	Course Title	Hours per week L-T-P	Credit C
EE1817PE41	FACTS	3-0-0	3

Pre-requisite:

Knowledge of power electronics based converters, various types of modulation techniques etc.

Course Outcomes

At the end of the course, the students will be able to:

CO1: Explain working principles of FACTs devices, their applications etc.

CO2: Model various FACTs devices and to implement them in various existing algorithms

CO3: Analyze the characteristics of AC transmission and the effect of shunt and series reactive compensation

CO4: Explain working and protection of various HVDC system

CO5: Design HVDC substation, three phase full wave bridge converters of various pulses

MODULE 1: FACTs Devices

Description and characteristics of thyristor based FACTs devices, their representation, opportunities of FACTs, Basic types of FACTS controllers, Relative importance of different types of controllers, Models of FACTs devices and their implementation in various existing algorithms. Basic concepts of voltage sourced converters (VSC), single phase full wave bridge converter operation, single phase pole operation.

MODULE 2: Phase Shifters

Principle and operation of single phase phase shifter, steady state model of a static phase shifter (SPS), power circuit configuration of SPS, SPS applications.

MODULE 3: Series Compensation and Shunt Compensation

Steady state voltage regulation and prevention of voltage collapse, power flow control, series compensation schemes, working principle, model and application of TCSC and SSSC, principle of shunt compensation, effect of shunt compensation of power angle diagram, principle of operation, configuration and control of SVC, STATCOM configuration and control, application of SVC, STATCOM etc.

MODULE 4: UPFC

UPFC: Its working principle, construction, control, uses etc.

MODULE 5: DC Transmission Technology

Comparison of AC and DC Transmission (Economics, Technical Performance and Reliability); Application of DC Transmission; Types of HVDC Systems; Components of a HVDC system. Line Commutated Converter and Voltage Source Converter based systems.

MODULE 6: Analysis of Line Commutated and Voltage Source Converters

Line Commutated Converters (LCCs): Six pulse converter; Analysis neglecting commutation overlap, harmonics, Twelve Pulse Converters; Inverter Operation; Effect of Commutation Overlap; Expressions for average dc voltage, AC current and reactive power absorbed by the converters; Effect of Commutation Failure, Misfire and Current Extinction in LCC links

Textbooks/ Reference Books:

7. S.L. Uppaland S. Rao, -Electrical Power Systemsl, Khanna Publishers

Course Code	Course Title	Hours per week L-T-P	Credit C
EE1817PE42	Renewable Energy Sources	3-0-0	3

Objectives

Introduce fundamental concepts in Renewable Energy Sources, advantages and disadvantages, design, simulation and their applications.

Course Outcomes

CO1: To comprehend the world energy situation and the notion of distributed end use energy and to understand the bad effects of the present concentration use of energy.

CO2: To understand the different types of renewable energy sources, their advantages/disadvantages and applications

CO3: To be able to know the basics of solar energy and to be able to design and development of solar photovoltaic/thermal systems.

CO4: To be able to model, analyze and design wind energy systems along with biomass based systems.

CO5: To be able to understand and analyze the energy from the ocean wave, Magneto-Hydro-Dynamic Generation and fuel cell.

MODULE 1: Introduction

Fossil fuel based systems, impact of fossil fuel based systems, renewable energy – sources and features, seasonal variations and availability, importance, primary & secondary energy sources, limitations to primary sources, various sources of renewable energy, applications

MODULE 2: Solar Energy Solar Geometry

Solar radiation, solar radiation angles, local solar time, solar radiation spectrum, radiation measurement, solar collector-flat plate collector & solar concentrator, solar heater-water heater & air heater, solar cooker, solar distillation, solar energy storage- sensible heat storage & latent heat storage.

MODULE 3: Solar Photovoltaic Systems

Operating principle, photovoltaic cell concepts, cell, module, array, series and parallel connections, Maximum power point tracking (MPPT)

MODULE 4: Wind Energy

Wind turbine rotor -classification, characteristics, Analysis of ideal wind turbine rotor, Power coefficient, Types of wind mills, Site selection Characteristics of wind generators

MODULE 5: Biomass

Operating principle, classification, design and applications

MODULE 6: Energy from the Ocean

Tidal energy, wave energy, ocean thermal energy conversion (OTEC) introduction, types, plants & their specifications

MODULE 7: Geo-Thermal Energy

Sources and use of geo-thermal energy, classification of geo-thermal power plants

MODULE 8: Magneto Hydro Dynamic

Generation Principles of MHD generation, MHD generator, equivalent circuits, MHD system

MODULE 9: Fuel Cell

Introduction, energy conversion principles, types of fuel cell, components of a fuel cell, polarization

5. F. E. Richart, Jr., J. R. Hall, Jr. and R. D. Woods, “Vibrations of Soils and Foundations”, Prentice-Hall International Series
6. IS 2974-1: “Code of Practice for Design and Construction of Machine Foundations”, Part 1: Foundation for Reciprocating Type Machines, Bureau of Indian Standards

Course Code	Course Title	Hours per week L-T-P	Credit C
EE1817PE43	Advanced Electrical Drives	3-0-0	3

Course Outcomes: At the end of this course the student will be able to:

1. Analyze the operation of power electronic converters and their control strategies
2. Analyze the vector control strategies for ac motor drives
3. Implement efficient control strategies for ac motor drives

MODULE 1: Power Converters for AC drives

PWM control of inverter, selected harmonic elimination, space vector modulation, current control of VSI, three level inverter, Different topologies, SVM for 3 level inverter, Diode rectifier with boost chopper, PWM converter as line side rectifier, current fed inverters with self-commutated devices. Control of CSI, H bridge as a 4-Q drive

MODULE 2: Induction Motor Drives

Different transformations and reference frame theory, modeling of induction machines, voltage fed inverter control-v/f control, vector control, direct torque and flux control (DTC)

MODULE 3: Synchronous Motor Drives

Modeling of synchronous machines, open loop v/f control, vector control, direct torque control, CSI fed synchronous motor drives

MODULE 4: Permanent Magnet Motor Drives

Introduction to various PM motors, BLDC and PMSM drive configuration, comparison, block diagrams, Speed and torque control in BLDC and PMSM

MODULE 5: Switched Reluctance Motor Drives

Evolution of switched reluctance motors, various topologies for SRM drives, comparison, Closed loop speed and torque control of SRM

MODULE 6: DSP Based Motion Control

Use of DSPs in motion control, various DSPs available, realization of some basic blocks in DSP for implementation of DSP based motion control

Textbooks/ Reference Books:

Course Code	Course Title	Hours per week L-T-P	Credit C
EE1817OE31	Optoelectronics	3-0-0	3

Course Objectives

- To know the basics of solid-state semiconductor physics and optical fiber wave-guides and understand the nature and characteristics of light.
- To study the performance parameters of optical source and detector and to understand different LED and laser types and their applications.
- To learn the principle of optical detection mechanism in different detection devices.
- To understand different light modulation techniques and the concepts and applications of optical switching.
- To become familiar with different optical sensors.

Course Outcomes

CO1: To review solid-state semiconductor physics and optical fiber wave-guides.

CO2: To understand the different types of optical sources, their advantages/disadvantages and applications.

CO3: To be able to know the basics of different optical detection devices

CO4: To be able to distinguish among different light modulation techniques and electro optic effects

CO5: To be able to design and development of optical sensors

MODULE 1: Optical Fiber Wave Guides

Theory of Dielectric slab waveguides-Symmetric and Asymmetric slab wave guide, Channel waveguide, Review of ray theory-Electromagnetic mode theory-Phase and group velocity-Modes-guided, radiative and leaky modes-‘V’ number-cut off wave length-Step index and graded index fibers-Parameters of optical fiber-problems. Signal degradation in fibers-Attenuation-Absorption loss-Linear and nonlinear scattering loss-Fiber bend loss-Dispersion mechanisms-Intramodal and intermodal dispersion-Expressions-modal noise-overall dispersion in single mode/multimode fibers-problems-mode coupling.

MODULE 2: Optical Sources

Light emitting diodes- P N junction characteristics- Direct and Indirect band gap materials-Spontaneous emission- Carrier concentration variation in n+p junction- carrier life time-Diffusion coefficient- Diffusion length- Injection efficiency- internal Quantum efficiency-Power internally generated- Overall efficiency of LED- problems- Heterojunction LEDs – Advantages- LED modulation- Electrical and Optical Bandwidth- LED structures-ELEDs and SLEDs-LED characteristics-Effect of temperature- LED Drive Circuits.

LASER diodes- Spontaneous Vs Stimulated emission-Einstein’s relation-population inversion-cavity resonance and threshold gain-Laser modes-stimulated emission in PN junction-Rate equation-condition for lasing-Laser diode characteristics-Modulation-frequency chirp Heterojunction LASER-LASER structures-LED Vs LASER diodes.

MODULE 3: Optical Detectors

Optical Detectors and Fiber optic link, classification of detectors-Photodiodes-PN junction photo diode-PIN photodiode- response and noise- APDs –Advantages of APD- APD Bandwidth and noise- Phototransistor-parameters of phototransistor-problems-Detector performance parameters-noises- NEP

Power launching and coupling- source to fiber coupling-joints- fiber to detector coupling- losses-fiber splicers, connectors and couplers-types-Fiber optic link-System considerations-link power budget-rise time budget-Link Design

MODULE 4: Electro Optic Effects

Birefringence phenomenon EO Retardation, EO Amplitude and Phase Modulator, Electro optic Intensity Modulators, Beam deflection, Acousto-optics, A-O Modulators, Integrated optic spectrum analyzer, Nonlinear optics second harmonic generation, Parametric amplification. Advanced system Technology-Optical Amplifiers-Raman and Erbium doped optical Amplifiers-Noises-Wave Length Division Multiplexing (WDM) and Components-Optical network-wave length routed networks.

MODULE 5: Optical Fiber Sensors

Fiber optic sensors-classification, Multimode fiber Sensors-Displacement, pressure, stress, strain. Intensity modulated sensors, Active multimode FO sensors, Micro-bend optical fiber sensor, Current sensors, Magnetic sensors, Single mode FO sensors, Phase modulated, Polarization modulated, Fiber Optic Gyroscope. Fiber bragg gratings for strain and temperature sensors-displacement sensor-optical computing concepts-optical logic gates.

2. G.D. Rai, Nonconventional energy sources, Khanna publishers
3. S.Hasan Saeed and D.K Sharma, Non-Conventional Energy Resources, Katson Books
4. S.K Dubey and S.K Bhargava, Non-Conventional Energy Resources, Dhanpat Rai & Co.

Course Code	Course Title	Hours per week L-T-P	Credit C
EE1817OE32	Computer Vision	3-0-0	3

Prerequisite: Digital Signal Processing as Open Elective-1, Digital Image Processing as Open Elective-2

COURSE OBJECTIVES

- This course is an introduction to the fundamental concepts and techniques in computer vision and their applications to solve real life problems

COURSE OUTCOMES: After completion of the course students will be able to

CO1: analyze mathematical formulation of 3D model image model and its coordinate system

CO2: analyze the algorithms of determining shape and depth of object from its image(s)

CO3: analyze performance of methods of determining shape and depth of object from its image(s)

MODULE 1: Image Formation

Radiometric Properties of Light Sources; Qualitative Radiometry; Sources and their Effects; Point Sources; Line Sources; Area Sources; Gourad & Phong Shading models; Shadows; Ambient Illumination; Photometric Stereo; Normal and Albedo from Many Views; Shape from Normals; Interreflections: Global Shading Models.

MODULE 2: Image Models

Coordinate Systems and Homogeneous Coordinates; Perspective Projection

MODULE 3: Shape from Texture

Representing Texture; Extracting Image Structure with Filter Banks; Analysis (and Synthesis) Using Oriented Pyramids; The Laplacian Pyramid; Shape from Texture: Planes and Isotropy; Recovering the Orientation of a Plane from an Isotropic Texture; Recovering the Orientation of a Plane from a Homogeneity Assumption; Shape from Texture for Curved Surfaces; Shape from Texture

MODULE 4: Geometry of Multiple Views

Two Views; Epipolar Geometry; Three Views; Trifocal Geometry; More than 3 Views; Stereopsis: Reconstruction; Camera Calibration; Image Rectification; Human Vision: Stereopsis; Binocular Fusion; Correlation; Multi-Scale Edge Matching; Dynamic Programming; Using More Cameras; Trinocular Stereo; Multiple-Baseline

MODULE 5: Affine Structure from Motion

Elements of Affine Geometry; Affine Structure from Two Images; The Affine Structure-from-Motion Theorem; Regularization theory; Optical computation; Optical flow; Motion estimation

MODULE 6: Projective Structure from Motion

Motion Estimation from Trifocal Tensors; Motion Estimation from Multiple Views

Course Code	Course Title	Hours per week L-T-P	Credit C
EE1817OE33	Electromagnetic Waves	3-0-0	3

COURSE OBJECTIVES

- This course is an introduction to the fundamental concepts of radiation, transmission or propagation and reception of electromagnetic waves

COURSE OUTCOMES: After completion of the course students will be able to

CO1: describe formulation mathematical models of radiation, transmission or propagation and reception of electromagnetic waves

CO2: analyze transmission or propagation of electromagnetic waves through conductor and dielectric media

CO3: analyze radiation from antenna and transmission or propagation of electromagnetic waves through wave guides

MODULE 1: Transmission Lines

Concept of distributed elements, Equations of voltage and current, Standing waves and impedance transformation, Lossless and low-loss transmission lines, Power transfer on a transmission line, Analysis of transmission line in terms of admittances, Transmission line calculations with the help of Smith chart, Applications of transmission line, Impedance matching using transmission lines.

MODULE 2: Maxwell's Equations

Basic quantities of Electromagnetics, Basic laws of Electromagnetics: Gauss's law, Ampere's Circuital law, Faraday's law of Electromagnetic induction. Maxwell's equations, Surface charge and surface current, Boundary conditions at media interface.

MODULE 3: Uniform Plane Wave

Homogeneous unbound medium, Wave equation for time harmonic fields, Solution of the wave equation, Uniform plane wave, Wave polarization, Wave propagation in conducting medium, Phase velocity of a wave, Power flow and Poynting vector.

MODULE 4: Plane Waves at Media Interface

Plane wave in arbitrary direction, Plane wave at dielectric interface, Reflection and refraction of waves at dielectric interface, Total internal reflection, Wave polarization at media interface, Brewster angle, Fields and power flow at media interface, Lossy media interface, Reflection from conducting boundary

MODULE 5: Waveguides

Parallel plane waveguide: Transverse Electric (TE) mode, transverse Magnetic (TM) mode, Cut-off frequency, Phase velocity and dispersion; Transverse Electromagnetic (TEM) mode, Analysis of waveguide-general approach, Rectangular waveguides

MODULE 6 Antennas

Radiation parameters of antenna, Potential functions, Solution for potential functions, Radiations from Hertz dipole, Near field, Far field, Total power radiated by a dipole, Radiation resistance and radiation pattern of Hertz dipole, Hertz dipole in receiving mode.

Course Code	Course Title	Hours per week L-T-P	Credit C
EE1817OE34	Electrical and Hybrid Vehicles	3-0-0	3

COURSE OBJECTIVES

- This course is an introduction to the fundamental concepts and techniques in Electrical and Hybrid Vehicles for energy efficient transportation systems

COURSE OUTCOMES:

After completion of the course students will be able to

CO1: analyze hybrid vehicles and their performance

CO2: explain the possible ways of energy storage

CO3: analyze the strategies related to energy storage systems

MODULE 1: Fundamentals

Conventional Vehicles: Basics of vehicle performance, vehicle power source characterization, transmission characteristics, mathematical models to describe vehicle performance;

Hybrid Vehicles: History of hybrid and electric vehicles, social and environmental importance of hybrid and electric vehicles, impact of modern drive-trains on energy supplies. Hybrid Electric Drive-trains: Basic concept of hybrid traction, introduction to various hybrid drive-train topologies, power flow control in hybrid drive-train topologies, fuel efficiency analysis

MODULE 2: Electric Trains

Electric Drive-trains: Basic concept of electric traction, introduction to various electric drive train topologies, power flow control in electric drive-train topologies, fuel efficiency analysis. Electric Propulsion unit: Introduction to electric components used in hybrid and electric vehicles, Configuration and control of DC Motor drives, Configuration and control of Induction Motor drives, configuration and control of Permanent Magnet Motor drives, Configuration and control of Switch Reluctance Motor drives, drive system efficiency

MODULE 3: Energy Storage

Energy Storage: Introduction to Energy Storage Requirements in Hybrid and Electric Vehicles, Battery based energy storage and its analysis, Fuel Cell based energy storage and its analysis, Super Capacitor based energy storage and its analysis, Flywheel based energy storage and its analysis, Hybridization of different energy storage devices; Sizing the drive system: Matching the electric machine and the internal combustion engine (ICE); Sizing the propulsion motor, sizing the power electronics, selecting the energy storage technology, Communications, supporting subsystems

MODULE 4: Energy Management Strategies

Energy Management Strategies: Introduction to energy management strategies used in hybrid and electric vehicles, classification of different energy management strategies, comparison of different energy management strategies, implementation issues of energy management strategies. Case Studies: Design of a Hybrid Electric Vehicle (HEV), Design of a Battery Electric Vehicle (BEV)

Textbooks/ Reference Books:

Course Code	Course Title	Hours per week L-T-P	Credit C
HS181704	Principles of Management	3-0-0	3

MODULE1: Introduction

Definition and meaning of management, Characteristics of management, importance of management, functions of management-planning, organising, directing, staffing, coordination and controlling etc., principles of management, Difference between administration and management

MODULE2: Financial Management

Definition and management of financial planning, importance and characteristics of sound financial plan, concepts of capital- fixed capital and working capital, source of finance, fund flow statement.

MODULE3: Marginal costing

Definition and meaning of marginal costing, advantages, marginal cost equation, contribution, profit-volume ratio, break even analysis, margin of safety.

MODULE4: Cost Accounting

Cost Accounting- Concept and benefit, elements of cost, preparation of cost sheet with adjustment of raw materials, work-in-progress and finished goods.

MODULE5: Capitalisation

Definition and meaning of capitalisation, over and under capitalisation.

MODULE6: Motivation

Introductory observation, definition of motivation, motivational technique, features of sound motivational system.

MODULE7: Leadership

Concept of leadership, principles of leadership, functions of leadership, qualities of leadership, different styles of leadership.

Textbooks/Reference Books:

1. Principle of Business Management: RK Sharma, Shashi K.Gupta
2. Business Organisation and Management: SS Sarkar, RK Sharma, Shashi K.Gupta
3. Industrial Organisation and Management: SK Basu, KC Sahu, B Rajvive
4. Principles of Management by Dr. A. K. Bora: Chandra Prakash, Guwahati.
5. Management Accounting: RK Sharma, Shashi K Gupta
6. Cost Accounting: SP Jain, K I Narang
7. Cost Accounting, RSN Pillai, V Bhagawati
8. Principles of Management: RN Gupta
9. Principles of Management: RSN Pillai, S. Kala
10. Principles of Management: Dipak Kumar Bhattacharj

Detail Syllabus:

Course Code	Course Title	Hours per week L-T-P	Credit C
EE1818PE51	Electrical Engineering Professional Practices	3-0-0	3

COURSE OBJECTIVES:

The main objective of this course is to introduce the students to the basic concepts of installation, testing, commissioning of electrical machines, estimation & costing of electrical machines and wiring, and preparation of tender papers.

COURSE OUTCOMES: After completion of the course students will be able to:

CO1: describe procedures of installation, testing, commissioning of electrical machines, estimation & costing of electrical machines and wiring, and preparation of tender papers

CO2: solve problems of installation, testing, commissioning of electrical machines, estimation & costing of electrical machines and wiring, and preparation of tender papers.

CO3: assess installation, testing, commissioning of electrical machines, estimation & costing of electrical machines and wiring, and tender papers.

MODULE 1: Transformers

Installation: Location & site; Foundation; code of practice for terminal plates; polarity & phase sequence; Oil tanks; Drying of windings with & without oil; General inspection.

Commissioning Tests: Voltage ratio; Earthing resistance; Oil strength; Buchholz & other relays; Tap changing gear; Fans & pumps; Insulation tests; Impulse test; Load & temperature rise tests

Specific Tests: Determination of performance & efficiency

MODULE 2: Induction Motors

Installation: Location of motor & control apparatus; Foundation & leveling; Shaft alignment for various coupling; Drying out of windings.

Commissioning Tests: Mechanical tests for alignment; Air-gap symmetry; bearings; Vibrations & balancing.

Electrical tests- Insulation test; Earthing; High voltage test; Starting up; Ability to speed up and take load.

Type & Routine Tests: In accordance with ISI Test code

Specific Tests: Performance & temperature rise tests; stray load losses; shaft currents

Maintenance Schedule

MODULE 3: Synchronous Machines

Installation: Physical inspection & alignment check; excitation system; cooling & control gear; Drying out.

Commissioning Tests: Insulation resistance; Resistance of armature & field windings; Polarity & phase sequence; Shaft current; Waveform & telephone interference factor; over speed test; Line charging capacity.

Performance Tests: Various tests to estimate the performance for generator and motor operation; Sudden short circuit tests and transient and sub-transient parameters; measurement of sequence impedances; separation of losses; Retardation test; temperature rise test.

Factory Tests: Gap length; Magnetic centrity; Balancing; Vibration; Bearing currents; Electrical tests.

MODULE 4: Estimating and Costing Electrical Wiring

Estimation of electrical load, size and type of electrical conductors, MCBs, Panels, TPNs, switches and sockets, Ceiling roses, Air conditioner points, Fan and Light points

MODULE 5: Tender Documents

Preparation and assessment of tender papers

TEXT BOOKS:

1. Electrical Wiring Estimating & Costing 2008 – S. L. Uppal, Khanna Publishers.
2. Installation, Commissioning & Maintenance of Electrical Equipment – P. P. Gupta, Dhanpat Rai Publications
- 3.

REFERENCE BOOKS:

1. Elect. Installation Works 6th Ed 1996 – T. G. Francis and R. J. Cooksley, Longman Higher Education, ELBS.
2. Electrical Installation and Workshop Technology (Vol-1 & 2) 4th Ed 1992 - F. G. Thompson, Longman Higher Education, ELBS
3. Installation, Commissioning & Maintenance of Electrical Equipment 2013 - Tarlok Singh, S. K. Kataria & Sons
4. Testing, Commissioning, Operation & Maintenance Of Electrical Equipments 2016 – S. Rao
5. A Course in Electrical Installation Estimating and Costing 2013 – J. B. Gupta, S. K. Kataria & Sons
6. Design & Testing of Elect. Machines - M. V. Deshpande, Wheeler
7. Electrical Substation Engineering & Practice: EHV-HVDC & SF-GIS (Principle, Practice, Design and Reference Data) 2003 – Sumathi Rao, Khanna Publishers
8. Electrical Workshop: Safety, Commissioning, Maintenance & Testing of Electrical Equipment 3rd Ed 2012 – R. P. Singh, I K International Publishing House Pvt. Ltd

Course Code	Course Title	Hours per week L-T-P	Credit C
EE1818PE52	Smart Grid Technology	3-0-0	3

COURSE OBJECTIVES:

To study distributed generation, smart transmission, smart distribution, smart consumption technology of electrical power, regulations and market models for smart grid

COURSE OUTCOMES (COs): After completion of the course students will be able to

CO1: describe structure, components and mathematical formulations for distributed generation, smart transmission, smart distribution, smart consumption technology of electrical power, regulations and market models for smart grid

CO2: solve problems of distributed generation, smart transmission, smart distribution, smart consumption technology of electrical power, regulations and market models for smart grid

CO3: analyze performance and characteristics of distributed generation, smart transmission, smart distribution, smart consumption technology of electrical power, regulations and market models for smart grid

MODULE 1: Introduction to Smart Grids

Definition, justification for smart grids, smart grid conceptual model, smart grid architectures, Interoperability, communication technologies, role of smart grids standards, intelligrid initiative, national smart grid mission (NSGM) by Govt. of India

MODULE 2: Smart Transmission Technologies

Substation automation, Supervisory control and data acquisition (SCADA), energy management system (EMS), phasor measurement units (PMU), Wide area measurement systems (WAMS)

MODULE 3: Smart Distribution Technologies

Distribution automation, outage management systems, automated meter reading (AMR), automated metering infrastructure (AMI), fault location isolation and service restoration (FLISR), Outage Management Systems (OMS), Energy Storage, Renewable Integration

MODULE 4: Distributed Generation and Smart Consumption

Distributed energy resources (DERs), smart appliances, low voltage DC (LVDC) distribution in homes or commercial buildings, home energy management system (HEMS), Net Metering, Building to Grid B2G, Vehicle to Grid V2G, Solar to Grid, Microgrid

MODULE 5: Regulations and Market Models for Smart Grid

Demand Response, Tariff Design, Time of the day pricing (TOD), Time of use pricing (TOU), Consumer privacy and data protection, consumer engagement; Cost benefit analysis of smart grid projects

TEXT BOOKS:

1. Clark W. Gellings: The Smart Grid, Enabling Energy Efficiency and Demand Side Response, CRC Press, 2009.
2. Jean Claude Sabonnadière, Nouredine Hadjsaïd: Smart Grids, Wiley-ISTE, IEEE Press, May 2012

3. India Smart Grid Knowledge Portal

Course Code	Course Title	Hours per week L-T-P	Credit C
EE1818PE53	VLSI Signal processing	3-0-0	3

COURSE OBJECTIVES:

- To teach Advance Concepts of Digital Signal Processing Algorithms

COURSE OUTCOMES: At the end of this course, the students will be able to

CO1: describe structure, components and mathematical formulation of VLSI signal processing systems

CO2: analyze VLSI signal processing systems

CO3: design VLSI signal processing systems for utilization in societal, academic and industrial purposes

MODULE 1: Iteration Bound

Typical DSP algorithms, DSP application demands and scaled CMOS technology, Representation of DSP algorithms; Data-flow graph representations, Loop bound and iteration bound, Algorithms for computing iteration bound, Iteration bound of multirate data-flow graphs

MODULE 2: Pipelining and Parallel Processing

Pipelining of FIR digital filters, Parallel processing, Pipelining and parallel processing for low power; Numerical strength reduction – Synchronous, Wave and Asynchronous pipe lines; Low power design

MODULE 3: Retiming, Unfolding, Folding

Retiming: Definitions and properties, Solving systems of inequalities, Retiming techniques.

Unfolding: An algorithm for unfolding, Properties of unfolding, Critical path, unfolding and retiming, Applications of unfolding.

Folding: Folding transformation, Register minimization techniques, Register minimization in folding architectures, Folding of multirate systems

MODULE 4: Systolic Architecture Design

Systolic array design methodology, FIR systolic arrays, Selection of scheduling vector, Matrix-matrix multiplication and 2D systolic array design, Systolic design for space representations containing delays; Scaling and round off noise; Digital lattice filter structures

MODULE 5: Bit-Level Arithmetic Architecture

Parallel multipliers, Interleaved floor-plan and bit-plane-based digital filters, Bit-serial multipliers, Bit-serial filter design and implementation, Canonic signed digit arithmetic, Distributed arithmetic; Bit level arithmetic architecture; Redundant arithmetic

MODULE 6: Programmable Digital Signal Processors

Evolution of programmable digital signal processors, Important features of DSP processors, DSP processors for mobile and wireless communications, Processors for multimedia signal processing

TEXT BOOKS:

Course Code	Course Title	Hours per week L-T-P	Credit C
EE1818PE54	Microwave Theory and Techniques	3-0-0	3

COURSE OBJECTIVES:

The main objective of this course is to introduce the students to the basic concepts of telecommunication through Microwave wireless devices and systems

COURSE OUTCOMES (COs): After completion of the course students will be able to:

CO1: Explain microwave system components their properties

CO2: Analyze microwave systems

CO3: Design microwave systems for practical application

MODULE 1: History and Applications

History of Microwaves, Microwave Frequency bands; Applications of Microwaves: Civil and Military, Medical, EMI/ EMC

MODULE 2: Mathematical Model of Microwave Transmission

Concept of Mode, Features of TEM, TE and TM Modes, Losses associated with microwave transmission, Concept of Impedance in Microwave transmission

MODULE 3: Analysis of RF and Microwave Transmission Lines

Coaxial line, Rectangular waveguide, Circular waveguide, Strip line, Micro strip line

MODULE 4: Microwave Network Analysis

Equivalent voltages and currents for non-TEM lines, Network parameters for microwave circuits, scattering Parameters

MODULE 5: Passive and Active Microwave Devices

Passive Microwave Devices: Directional Coupler, Power Divider, Magic Tee, Attenuator, Resonator

Passive Microwave Devices: Diodes, Transistors, Oscillators, Mixers; Microwave Semiconductor Devices: Gunn Diodes, IMPATT diodes, Schottky Barrier diodes, PIN diodes; Microwave Tubes: Klystron, TWT, Magnetron

MODULE 6: Microwave Design Principles

Impedance transformation, Impedance Matching, Microwave Filter Design, RF and Microwave Amplifier Design, Microwave Power Amplifier Design, Low Noise Amplifier Design, Microwave Mixer Design, Microwave Oscillator Design

MODULE 7: Microwave Antennas

Antenna parameters, Antenna for ground based systems, Antennas for airborne and satellite borne systems, Planar Antennas

MODULE 8: Microwave Measurements

Power, Frequency and impedance measurement at microwave frequency, Network Analyzer and measurement of scattering parameters, Spectrum Analyzer and measurement of spectrum of a microwave signal, Noise at microwave frequency and measurement of noise figure; Measurement of Microwave antenna parameters

MODULE 9: Microwave Systems

Radar, Terrestrial and Satellite Communication, Radio Aids to Navigation, RFID, GPS

MODULE 10: Modern Trends in Microwaves Engineering

Effect of Microwaves on human body, Medical and Civil applications of microwaves, Electromagnetic interference and Electromagnetic Compatibility (EMI & EMC), Monolithic Microwave ICs, RFMEMS for microwave components, Microwave Imaging

TEXT BOOKS:

1. R.E. Collins: Microwave Circuits, McGraw Hill
2. A. K. Maini: Microwaves and Radar – Principles and Applications, Khanna Publishers

REFERENCE BOOKS:

1. K.C. Gupta, I.J. Bahl: Microwave Circuits, Artech house
2. V. Chandrasekar: Communication System, Oxford University press, India

Course Code	Course Title	Hours per week L-T-P	Credit C
EE1818PE55	HVDC	3-0-0	3

Objectives: Introduce fundamental concepts of High Voltage DC Transmission system

Course Outcomes: After the completion of this course the student will be able to

CO1: explain working principles and protection of HVDC devices and systems

CO2: design HVDC system

CO3: analyze characteristics and performances of HVDC devices and systems.

MODULE 1: DC Transmission Technology

Comparison of AC and DC transmission; Application of DC transmission; Description of DC transmission system planning for HVDC transmission; Modern trends in DC transmission.

MODULE 2: Analysis of HVDC Converters

Pulse number; Choice of converter configuration; Simplified analysis of Graetz circuit; Line Commutated Converters (LCCs): Six pulse converter; Analysis neglecting commutation overlap, harmonics, Twelve Pulse Converters; Inverter Operation; Effect of Commutation Overlap; Expressions for average dc voltage, AC current and reactive power absorbed by the converters; Effect of Commutation Failure, Misfire and Current Extinction in LCC links

MODULE 3: Converter and HVDC System Control

General principles of DC link control; Converter control characteristics; System control hierarchy; Firing angle control– Phase-Locked Loop; Current and Extinction angle control; Starting and Stopping of DC link; Power control; Higher level controllers; Telecommunication requirements

MODULE 4: Harmonics and Filters

Introduction-generation of harmonics; Design of AC filters; DC filters; Carrier frequency and Radio Interference (RI) noise

MODULE 5: Stability Enhancement Control

Basic Concepts: Power System Angular, Voltage and Frequency Stability; Power Modulation: basic principles – synchronous and asynchronous links; transient stability improvement using DC link.

Textbooks/ Reference Books:

1. K. R. Padiyar: HVDC power transmission system, Wiley Eastern Limited, New Delhi, 1990.
2. P. Kundur: Power System Stability and Control, Tata McGraw-Hill Publishing Company Ltd., USA, 1994.
3. J. Arrillaga: High Voltage Direct Current Transmission, Peter Pregrinus, London, 1983.
4. Edward Wilson Kimbark: Direct Current Transmission, Vol. I, Wiley Interscience, New York, London, Sydney, 1971.
5. Rakosh Das Begamudre: Extra High Voltage AC Transmission Engineering, New Age International (P) Ltd., New Delhi, 1990.
6. S. S. Rao: EHV-AC, HVDC Transmission and Distribution Engineering, Khanna Publishers
7. S. L. Uppal and S. S. Rao: Electrical Power Systems, Khanna Publishers

Course Code	Course Title	Hours per week L-T-P	Credit C
EE1818PE61	Power System Dynamics and Control	3-0-0	3

MODULE 1: Power System Stability

Introduction power system dynamics – slow and fast dynamics, classifications and issues for applications. Modeling of a power system for dynamic analysis – lumped representation of a power system with single machine and single load concept, swing equation. Power- angle curve. Steady- state and transient Stabilities. Equal area criterion. Analysis of stability analysis using HVDC link in a power system. Calculation of power – angle curves for fault and post – fault conditions for various types of Fault; effect of reclosing. Numerical solution of swing equation.

MODULE 2: Synchronous Machine Modeling and Power System Dynamics

Fundamental of single and three phase synchronous machine, modeling of three-phase machine – voltage equation, induction matrix elements, Park’s Transformation, Equivalent circuit. Operation of Three-phase synchronous machine under balanced steady-state condition, Transient and Sub-transient parameters of Three-phase synchronous machine and machine modeling with these parameters.

MODULE 3: Load Frequency Control (LFC) of a Power System

Introduction power system LFC Modeling of a power system for LFC as single area system with governor and turbine model. LFC model for two or multi-area power system. State model for LFC of single and multi-area power system. Fundamental of Optimal control, Riccati equation, Optimal LFC of a power system. Frequency control issues with generator rate control, speed governor dead-band effect.

MODULE 4: Small- Signal Stability Analysis of Power System

Generation representation using classical model, State equations and block diagram, State variable representation of generator voltage and electrical torque. Effect of excitation system Effect of AVR on synchronous a damping torque.

MODULE 5: Transient Stability Analysis for Multi-Machine Power System

Introduction. Modeling of interconnecting power system for multi-machine power system transient stability analysis. Modification of load flow analysis model for transient stability analysis, solution algorithm for transient stability analysis of an interconnected power system.

Textbooks/ Reference Books:

1. Computer Methods in Power System Analysis – Stagg and El-Abiad, McGraw-Hill publication
2. Power system interconnection and control - Murty.
3. Power System Dynamics Analysis and Simulation – R Ramanujam, PHI Learning PLTD

Course Code	Course Title	Hours per week L-T-P	Credit C
EE1818PE62	Illumination Engineering	3-0-0	3

COURSE OBJECTIVES:

- To impart the basic knowledge about radiation, entities in the illumination system, human eye and vision
- To inculcate the understanding of various mathematical relations between brightness and luminosity, light sources and their characteristics etc
- To understand light control
- To know about measurement of illumination and design.

COURSE OUTCOMES:

At the end of the course, the students will be able to:

CO1: Understand the physics behind various luminous sources, laws of illumination and illumination standards.

CO2: Assess the structure and visual characteristics of human eye with respect to response to glare and colors.

CO3: Evaluate the performance of various light sources based on their optical characteristics.

CO4: Compare illumination levels from various sources and perform measurement experiments for appropriate applications.

CO5: Design efficient lighting systems for various application areas.

MODULE 1: Radiation

Wavelength, frequency & velocity. The radiation spectrum. Radiations from black bodies & other sources.

MODULE 2: Entities in the Illumination System and their Units

Luminous sources, illumination, intensity, brightness, other terms and units. The inverse square law. The cosine law. Solid angle relationship. Luminosity, relationship between brightness & luminosity for a perfectly diffusing source, illumination standards.

MODULE 3: The Eye & Vision

The structure of the eye, accommodation, aberration of the eye, the rods & cones, visual acuity, glare, color & color response of the eye.

MODULE 4: Light Sources & Their Characteristics

Day light incandescent, electric discharge (low & high pressure), fluorescent, arc lamps and laser beams, color rendering, wiring, switching & control circuits. Starters & ballast.

MODULE 5: Light Control

Reflection & reflection factor, absorption, transmission & transmission factor. Control of light by luminaries.

MODULE 6: Illumination & Measurement

Illumination from point sources, light units in a row, area illumination, polar curves. Linear & surface sources, flat linear source, flat-strip of short length. Illumination of a vertical source. Radiant energy

detectors, PV cell, Photo-tubes, Photometry, Electro-photometry, Photo cells, Spectro-photometer, Colorimeters.

MODULE 7: General Illumination & Design calculation

Interior lighting of industrial, residential & commercial buildings. Effective utilizations of daylight. Daylight factor, Outdoor lighting, Street, rail/shipyards, airports, sports area. Lighting design for signaling, advertising & security.

Textbooks/ Reference Books:

1. Cotton.H, Principles of Illumination, Chapman & Hall.
2. Boast. W.S., Illumination Engineering, McGraw-Hill.
3. IES Lighting Handbook, Illumination Engineering Society, New York.
4. Energy Management in Illuminating Systems—Kao Chen

Course Code	Course Title	Hours per week L-T-P	Credit C
EE1818PE63	Power Quality Analysis and Assessment	3-0-0	3

MODULE 1: Introduction

Power quality and its importance, transients, long duration voltage variations, short durations, voltage variations, waveform distortions, voltage fluctuations, power frequency variations.

MODULE 2: Voltage Sags and Interruptions

Sources of sags and interruptions, Estimating voltage sag performance, mitigation of voltage sags: active series compensators, Static transfer switches and fast transfer switches, solution at the end user level and their economic implications.

MODULE 3: Transients Overvoltage

Source of transient's overvoltage, principles of overvoltage protection, devices for overvoltage protection

MODULE 4: Harmonics

Harmonic distortions, sources of harmonics and their locations, effects of harmonics Harmonic distortion evaluation - devices for controlling harmonic distortion - passive and active filters. IEEE standards.

MODULE 5: Long Duration Voltage Variations

principles of regulating the voltage, devices for voltage regulation

MODULE 6: Power Quality Benchmarking

Benchmarking processes, RMS voltage variation indices, harmonic indices, Power Quality State Estimator (PQSE)

MODULE 7: Power Quality Monitoring

Monitoring considerations - monitoring and diagnostic techniques for various power quality problems - modeling of power quality (harmonics and voltage sag) problems by mathematical simulation tools - power line disturbance analyzer – Quality measurement, equipment - harmonic / spectrum analyzer - flicker meters - disturbance analyzer, Applications of expert systems for power quality monitoring

Textbooks/ Reference Books:

1. Roger. C. Dugan, Mark. F. Mc Granagham, Surya Santoso, H.Wayne Beaty, 'Electrical Power Systems Quality' McGraw Hill,2003.

Course Code	Course Title	Hours per week L-T-P	Credit C
EE1818PE64	Industrial Electrical Systems	3-0-0	3

Course Outcomes: At the end of this course the student will be able to:

CO1: Explain the electrical wiring systems for residential, commercial and industrial consumers, representing the systems with standard symbols and drawings

CO2: Explain the construction and working components of industrial electrical systems.

CO3: Design the proper size of electrical system components.

MODULE 1: Electrical System Components

LT system wiring components, selection of cables, wires, switches, distribution box, metering system, Tariff structure, protection components- Fuse, MCB, MCCB, ELCB, inverse current characteristics, symbols, single line diagram (SLD) of a wiring system, Contactor, Isolator, Relays, MPCB, Electric shock and Electrical safety practices

MODULE 2: Residential and Commercial Electrical Systems

Types of residential and commercial wiring systems, general rules and guidelines for installation, load calculation and sizing of wire, rating of main switch, distribution board and protection devices, earthing system calculations, requirements of commercial installation, deciding lighting scheme and number of lamps, earthing of commercial installation, selection and sizing of components.

MODULE 3: Illumination Systems

Understanding various terms regarding light, lumen, intensity, candle power, lamp efficiency, specific consumption, glare, space to height ratio, waste light factor, depreciation factor, various illumination schemes, Incandescent lamps and modern luminaries like CFL, LED and their operation, energy saving in illumination systems, design of a lighting scheme for a residential and commercial premises, flood lighting.

MODULE 4: Industrial Electrical Systems-I

High Tension (HT) connection, industrial substation, Transformer selection, Industrial loads, motors, starting of motors, Single Line Diagram (SLD), Cable and Switchgear selection, Lightning Protection, Earthing design, Power factor correction – kVAR calculations, type of compensation, Introduction to PCC, MCC panels; Specifications of Low Tension (LT) Breakers, Miniature Circuit Breaker (MCB) and other LT panel components.

MODULE 5: Industrial Electrical Systems-II

Diesel Generator (DG) Systems, UPS System, Electrical Systems for the elevators, Battery banks, Sizing the DG, Uninterrupted Power Supply (UPS) and Battery Banks, Selection of UPS and Battery Banks

MODULE 6: Industrial Electrical System Automation

Study of basic Programmable Logic Controller (PLC), Role of in automation, advantages of process automation, PLC based control system design, Panel Metering and Introduction to SCADA system for distribution automation.

Text Books:

1. S. L. Uppal and G. C. Garg, -Electrical Wiring, Estimating & Costing, Khanna publishers, 2008.
2. H. Joshi, -Residential, Commercial and Industrial Systems, McGraw-Hill, 2008

3. Web site for IS Standards.

Course Code	Course Title	Hours per week L-T-P	Credit C
EE1818PE71	Utilization and Conservation of Electrical Energy	3-0-0	3

Course Outcomes:

At the end of the course, the students will be able to:

- CO1:** Analyze various procedures, circuits, practices employed for different types of electric heating.
- CO2:** Compare various types of welding, AC and DC power supplies used for welding and to choose circuits used in welding.
- CO3:** Justify the use of various traction motors in electric traction, apply their starting & speed control techniques and summarise knowledge of various energy storage devices.
- CO4:** To assess electrical energy losses and examine procedures for energy conservation and co-generation.
- CO5:** To associate with energy audit, its classification, methodology and instrumentation.

MODULE 1: Electric Heating

Advantages, Classification, Resistance Heating, Furnaces, Requirements and Design of heating elements, Temperature control, Electric arc furnaces, Direct & Indirect, Construction & Operation, Electrodes & Power Supply, High Frequency Heating, Induction Heating, Working principle, Power & High frequency Heating, Choice of Frequency, Core type & Coreless Furnaces, Skin Effect & Pinch effect, High Frequency Supply, Advantages & Disadvantages, Dielectric Heating, Working principle, Choice of Voltage and Frequency, Advantages & Applications.

MODULE 2: Electric Welding

Classifications, Resistance Welding: Spot, Butt, Seam. Arc welding: types, electrode used, power sources and control circuits. Atomic hydrogen welding. Modern development.

MODULE 3: Electric Traction

Advantages. Systems of electric traction. Choice of system voltage and frequency. The Indian scenario. Types of train services. Train movements and energy consumption. Speed-time, distance-time and energy consumption curves. Tractive effort, Adhesion, Train resistance. Power supply arrangements. Substation equipment. D.C AND A.C. traction motors, their disposition and operation on tram cars, motor coaches and locomotives. Control systems; Rheostatic, field control and seriesparallel using shunt and bridge transition methods. Multiple unit control. Metadyne control. Controllers for dc & ac traction motors. Tram Cars, Motor coaches, & Trolley Buses. Auxiliary Electrical Equipments for Tram cars, Motor Coaches & Locomotives. Braking: mechanical, vacuum & electrical.

MODULE 4: Energy Storage

Size & Duration of storage. Modes of energy storage: mechanical, electrical, magnetic, thermal & chemical. Comparison of the different systems.

MODULE 5: Electrical Losses & Energy Conversion

Electrical transmission, distribution & utilization losses. Classification. Reduction of losses. Benefits of electrical energy conservation. Energy conservation in lighting, electric furnaces, electric drive, traction systems. Use of energy –efficient equipment.

MODULE 6: Electrical Energy Audit

Introduction, benefits, procedure for energy audit. Instruments for energy audit. Methodology. Case study.

Textbooks/ Reference Books:

1. Electrical Energy Utilization & Conservation, by Tripathy, S.C ; TMG
2. Utilization of Electric power ; by Suryanarayan, N.V. : Wiley Eastern Ltd.
3. Art and Science of Utilization of Electrical Energy'by H Partab: Dhanpat Rai and Sons
4. Utilization of Electric Power and Electric Traction By J B Gupta: S K Kataria and Sons
5. Generation, Distribution and Utilization of Electrical Energy By C L wahhwa: New Age International (P) limited Publishers

Course Code	Course Title	Hours per week L-T-P	Credit C
EE1818PE72	Artificial Intelligence Applications in Electrical Engineering	3-0-0	3

COURSE OBJECTIVES:

- To provide fundamentals of intelligent systems technologies including knowledge-based systems, neural networks, fuzzy systems, and evolutionary computation.
- To provide adequate knowledge of application of Neural Networks, Fuzzy logic and hybrid model for solving Electrical Engineering problems.

COURSE OUTCOMES:

At the end of this course, the students will be able to:

CO1: Explain neural networks behavior and use them for classification, control system and optimization problem

CO2: Gain a working knowledge of fuzzy controllers used in engineering problems.

CO3: Obtain the optimum solution of well formulated optimization problem using evolutionary approaches.

CO4: Formulate hybrid intelligent algorithms for the application of engineering problems.

MODULE 1: Introduction

Definition, History of AI, Approaches to AI, AI technologies. Importance of AI, Application areas of AI, Comparisons with conventional program-classical problem solving methods and heuristic search techniques

MODULE 2: Neural Network

Introduction: Biological neurons, Models of single neurons, Artificial and biological neural networks, Fundamental neurocomputing concepts, activation functions, neural network architectures, Single layer and Multi layers networks. Kohonen Self-Organizing Maps: The SOM algorithm

Training: Learning rules - Supervised learning and unsupervised learning. Hebb's rule, Delta rule, Multi-layer feedforward neural networks, Back propagation Learning.

MODULE 3: Fuzzy Logic Classical & Fuzzy Sets

Introduction to classical sets – properties, Operations and relations; Fuzzy sets, Membership, Uncertainty, Operations, properties, fuzzy relations, cardinalities, membership functions.

Fuzzy Logic System Components: Fuzzification, Membership value assignment, fuzzy IF-THEN rules and fuzzy reasoning, development of rule base and decision making system, fuzzy inference engines, defuzzification to crisp sets, defuzzification methods and their methods.

MODULE 4: Evolutionary Computation

Chromosomes, fitness functions, and selection mechanisms Procedure of Genetic Algorithm, Genetic Representation, Initialization and selection, Genetic Operators- cross over, mutation, Elite strategy and selection, Termination Criteria.

MODULE 5: Hybrid Intelligent Systems

Hybrid systems – integration of fuzzy logic, neural networks and genetic algorithms – nontraditional optimization techniques like ant colony optimization – Particle swarm optimization.

MODULE 6: Applications

Applications of ANN in load forecasting, detection of fault in distribution system, Power system dynamic load modelling, stability analysis.

Applications Fuzzy logic in Economic Dispatch, Unit Commitment, load flow study, detection of faults, Schedule maintenance, Electrical Machines.

Textbooks/ Reference Books:

2. P. Jakson- Introduction to Expert Systems, Addison Wesley.
3. D.W. Ralston- Principles of Artificial Intelligence& Expert Systems, McGraw Hill.
4. George F.Luger, 'Artificial Intelligence – Structures and Strategies for Complex Problem Solving',FourthEdition,PearsonEducation,2002.
5. Janakiraman, K.Sarukesi, 'Foundations of Artificial Intelligence and Expert Systems', Macmillan Series in Computer Science.
6. W. Patterson, 'Introduction to Artificial Intelligence and Expert Systems', Prentice Hall of India, 2003.

Course Code	Course Title	Hours per week L-T-P	Credit C
EE1818PE73	Power System Instrumentation	3-0-0	3

MODULE 1: Different Types of Instruments

Voltmeter –analog /digital, ammeter-analog/digital, frequency meter, induction type energy meter, 3 phase energy meter, Vector meter, tri vector meter, analog VAR meter.

MODULE 2: Measurement of Large Currents and Voltages

introduction, high voltage measurement technique for DC/AC voltage measurement, Buffer system: ratio and phase angle error, Pulse trained energy meter

MODULE 3: Measurements in Power Plants

Electrical measurements – Current, voltage, power, frequency, power factor etc. – Non electrical parameters – Flow of feed water, fuel, air and steam with correction factor for temperature – Steam pressure and steam temperature – Drum level measurement – Radiation detector – Smoke density measurement – Dust monitor

MODULE 4: Data Loggers and Data Display System

MODULE 5: Telemetry

Introduction, component, short term telemetering, Data transmission channels-PLCC, microwave links

MODULE 6: SCADA

MODULE 7: Introduction to PMUs and their Placement

Textbooks/ Reference Books:

1. Cooper Helfrick, “Electrical Instrumentation and Measuring Techniques”, Prentice Hall India, 1986
2. D. C. Nakra and K. K. Chowdhry, “Instrumentation, Measurement, and Analysis”, Tata McGraw Hill Publishing Co., 1984.
3. Selected topics from IEEE, AIEE and CIGRE Journals

Course Code	Course Title	Hours per week L-T-P	Credit C
EE1818OE41	Reliability Engineering	3-0-0	3

COURSE OBJECTIVES:

1. To study fundamental concepts of reliability and its applications in engineering
2. To study reliability evaluation techniques

COURSE OUTCOMES (COs):

After successful completion of the course student should be able to:

CO1: Understand fundamental concepts of probability and statistics and its applications in reliability engineering

CO2: Develop reliability block diagram and evaluate reliability of engineering systems.

CO3: Apply various techniques to evaluate reliability of components or systems using failure density functions and failure rate/hazard rate functions

CO4: Develop and analyze Markov model for a system and evaluate steady-state availability and reliability

CO5: Develop and implement maintenance based models for reliability evaluation of systems

MODULE 1: Introduction

Definition of reliability, reasons for reliability engineering programmes, applications and benefits, Failure- causes of failures, modes of failures, failure rate; life characteristics pattern (Bath-tub curve)

MODULE 2: Basic Probability Theory

Basic probability theorems, random variables, probability distributions, mean and standard deviation, median and mode, binomial distribution

MODULE 3: System Modeling-I

Reliability block diagrams: series, parallel, series-parallel combination, partially redundant system, standby system, complex systems; Reliability evaluation techniques

MODULE 4: System modeling-II

Failure density function, cumulative failure distribution function, reliability function, failure rate and hazard rate function, MTTF, MTTR and MTBF, Reliability evaluation using distributions

MODULE 5: Markov Modeling

Markov process and general concept of modeling; Markov models of repairable systems, Stochastic transitional probability matrix; Steady-state availability

MODULE 6: Maintained Systems

Maintenance: objectives, types and forms of maintenance, Maintainability; Preventive maintenance, Corrective maintenance; Maintenance based reliability models

4. E. E. Lewis, Introduction to Reliability Engineering, John Wiley and Sons, 1996.

5. A K. Govil: Reliability Engineering, Tata McGraw Hill Publishing Comp. Ltd., 1983.
6. Dimitri Kececioglu: Reliability Engineering Handbook (Vol 1), Prentice Hall PTR, 1991.
7. M. L. Shooman, Probabilistic Reliability- an engineering approach, McGraw Hill Book Company, 1968.

Course Code	Course Title	Hours per week L-T-P	Credit C
EE1818OE42	Web Technology	3-0-0	3

MODULE 1: DHTML

Object model and Collections, Event model, Filters and Transitions, Data binding with tabular data control, XML – XML vocabularies, Document Object Model, SAX, Simple Object Access Protocol(SOAP), Extensible Style sheet Language(XSL)

MODULE 2: Server Side Scripting Languages

JSP- Introduction to JSP, JSP Architecture, Scripting components, Standard actions, JSP with JDBC.

MODULE 3: PHP

Introduction (variables, control statements etc.), String processing and regular expression, Form processing and business logic, connecting to a database, Cookies, Dynamic content in PHP

Text Books:

1. Deitel & Deitel, JAVA: How to Program, Pearson education, 7th edition, 2008.
2. Deitel & Deitel, Internet and World Wide Web How to Program, Pearson education, 3rd edition, 2005.

Reference Books:

1. Ivan Bay Ross, Web Enabled Commercial Application using Java 2, BPB publication, 1998.
2. David Flanagan, Java Script the Definitive Guide, O'reilly, 5th edition, 2006.

Course Code	Course Title	Hours per week L-T-P	Credit C
EE1818OE43	Optical Communication Engineering	3-0-0	3

COURSE OUTCOMES: At the end of the course the student will be able to:

CO1: Explain the properties of the optical fibers and optical components.

CO2: Analyze operation of lasers, LEDs and detectors

CO3: Analyze system performance of optical communication systems

CO4: Analyze non-linear effects in optical fibers

MODULE 1: Review of Theory of Light

Introduction to vector nature of light, propagation of light, propagation of light in a cylindrical dielectric rod, Ray model, wave model.

MODULE 2: Optical Fibers

Modal analysis of a step index fiber; Signal degradation on optical fiber due to dispersion and attenuation; Fabrication of fibers and measurement techniques like OTDR

MODULE 3: Optical Sources and Link Design

LEDs and Lasers, Photo-detectors - pin-diodes, APDs, detector responsivity, noise, optical receivers; Optical link design: BER calculation, quantum limit, power penalties.

MODULE 4: Optical Switches

Coupled mode analysis of directional couplers; electro-optic switches.

MODULE 5: Optical Amplifiers

EDFA, Raman amplifier; WDM and DWDM systems; Principles of WDM networks

MODULE 6: Nonlinear Effects in Fiber Optic Links

Concept of self-phase modulation, group velocity dispersion and solution based communication.

Course Code	Course Title	Hours per week L-T-P	Credit C
EE1818OE44	Computer Graphics	3-0-0	3

Course Outcomes (COs): At the end of this course students will be able to

CO1: Solve problems of Geometric Transformation applicable to Computer Graphics

CO2: Develop algorithms to draw specific objects on computer screen

CO3: Develop programs to draw specific objects on computer screen using OpenGL

CO4: Synthesize 3D objects for visualization on computer screen

MODULE 1: General Concepts

History of computer graphics, applications, graphics pipeline, physical and synthetic images, synthetic camera, modeling, animation, rendering, relation to computer vision and image processing, review of basic mathematical objects (points, vectors, matrix methods)

MODULE 2: Fundamentals of OpenGL

OpenGL architecture, primitives and attributes, simple modeling and rendering of two- and three-dimensional geometric objects, indexed and RGB color models, frame buffer, doublebuffering, GLUT, interaction, events and callbacks, picking.

MODULE 3: Geometric Transformations

Homogeneous coordinates, affine transformations (translation, rotation, scaling, shear), concatenation, matrix stacks and use of model view matrix in OpenGL for these operations.

MODULE 4: Viewing

Classical three dimensional viewing, computer viewing, specifying views, parallel and perspective projective transformations; Visibility- z-Buffer, BSP trees, Open-GL culling, hidden-surface algorithms.

MODULE 5: Shading

Light sources, illumination model, Gouraud and Phong shading for polygons, Rasterization- Line segment and polygon clipping, 3D clipping, scan conversion, polygonal fill, Bresenham's algorithm.

MODULE 6: Discrete Techniques

Texture mapping; compositing; textures in OpenGL; Ray Tracing- Recursive ray tracer, ray-sphere intersection

MODULE 7: Representation and Visualization

Bezier curves and surfaces, B-splines, visualization, interpolation, marching squares algorithm
